Specifically—3. [*cap.*] The supreme legislative body of the United Kingdom of Great Britain and Ireland, consisting of the three estates of the realm, namely the lords spiritual, the lords temporal, and the commons; the general council of the nation, constituting the legislature, summoned by the sovereign's authority to consult on the affairs of the nation and to enact and repeal laws. Primarily, the sovereign may be considered as a constituent element of Parliament; but the word as generally used has exclusive reference to the three estates above named, ranged in two distinct branches, the House of Lords and the House of Commons. The House of Lords includes the lords spiritual and lords temporal. (See *House of Lords*, under *lord*.) The House of Commons consists of 670 members: viz., for England and Wales, 253 representatives of county constituencies (counties or divisions of counties), 237 of boroughs, and 5 of universities; for Scotland, 39 representatives of counties, 31 of burghs, and 2 of universities; for Ireland, 85 representatives of counties, 16 of boroughs, and 2 of a university. The authority of Parliament extends over the United Kingdom and all its colonies and foreign possessions. The duration of a Parliament was fixed by the Septennial Act of 1716 at seven years, but it seldom even approaches its limit. Sessions are held annually, usually from about the middle of February to the end of August, and are closed by prorogation. Government is administered by the ministry (see *ministry and cabinet*), which is sustained by a majority in the House of Commons. Should the ministry be outvoted in the house on a question of vital importance, it either resigns office or dissolves Parliament and appeals to the country. The precursors of the Parliament were the Witenagemot in the Anglo-Saxon period and the National Council in the Norman and Angevin periods. The composition and powers of Parliament were developed in the thirteenth and fourteenth centuries; the right of representation from shires and towns dates from 1295, and the separation of the two houses dates from the middle of the fourteenth century. Parliamentary government was in large measure suspended from 1461 to the middle of the reign of Henry VIII. Prolonged struggles between the Parliament and the crown took place under James I. and Charles I., which led to the Civil War and the Commonwealth. The Triennial Act of 1694 (modified by the Septennial Act of 1716) fixed the life of Parliament at three years, and government by party dates from the same period. The right of election to Parliament has been greatly modified by the Reform Acts of 1832, 1867, and 1884, and the Redistribution Act of 1885.

I find that you have made choice of me to be one of your Burgesses for this now approaching *Parliament*.
Howell, Letters, I. v. 4.

When the Duke of Suffolk opened *parliament*, all the members, every time the king's name occurred, bowed until their heads all but touched the ground.
Stubbs, Medieval and Modern Hist., p. 289.

4. [*cap.*] One of similar legislative bodies constituting the legislatures of the Dominion of Canada, New South Wales, Tasmania, Victoria, and other self-governing colonies of the British empire. The Parliament of the Dominion of Canada, established by royal proclamation in 1867, consists of two houses—a Senate, or upper house, whose members, 81 in number, are nominated for life by the governor-general, and a House of Commons, whose members are elected for

five years by the people of the different provinces, there being one representative for every 20,000 of the population. In the other colonies the two houses are usually styled the *Legislative Council* and the *Legislative Assembly*. The members of the latter body are elected; the members of the former body may be elected, as in Tasmania, or nominated by the crown, as in New South Wales.

5. In France, before the revolution of 1789, one of several courts, including various provincial parliaments, and especially the Parliament of Paris (see below).—6. Act of Parliament, a statute, law, or edict made by the sovereign, with the advice and consent of the lords temporal and spiritual and the commons in Parliament assembled. Such an act cannot be altered, amended, dispensed with, suspended, or repealed but by the same authority of Parliament which has created it.—**Added Parliament**, the Parliament in session from April to June, 1614. See the quotation.

All attempts of a compromise on the subject [impositions on merchandise] having failed, James in February, 1611, dissolved the parliament, and a second parliament which he summoned in 1614 proving equally recalcitrant was also dissolved, the fact that it was not allowed the opportunity of transacting business earning for it from the courtiers the name of the *added parliament*.

See *clerk*.—**Convention Parliament**. See *convention*, 3(c).—**Drunken Parliament**, in *Scottish hist.*, the Parliament which assembled after the restoration of Charles II. It met in 1661, and was strongly Royalist.—**Free Parliament**. Same as *Convention Parliament*.—**Good Parliament**, the Parliament which assembled under Edward III., in 1376; so called because of its endeavors to reform corruption in the court and the government.—**High Court of Parliament**, the general designation of the English Parliament, which originally acted as the council of the king, but which after it was established at Westminster sitting in separate bodies as the Lords and the Commons was together technically designated by this name, and either house was spoken of as the Lords, or the Commons, "in the High Court of Parliament assembled." In later times, the phrase is more commonly used of either house, or both houses, acting in the exercise of judicial or quasi-judicial functions, such as the inquest by the Commons and the trial by the Lords of an impeachment, or the action of either house, or both successively, on a bill of attainder, a question of contempt, the removal and punishment of public officers, etc., as distinguished from functions of legislation and functions as council of the king.

Gray Parrot (*Psittacus erythacus*).

more specific names. When used in a stricter sense, it usually refers to Old World birds of moderate or rather large size, of stout build, with strong beak, fleshy tongue, and short square tail, as in the restricted genus *Psittacus*, of which the African *P. erythacus*, of a gray color with a bright-red tail, is a characteristic example and one of the commonest of cage-birds. The natural cries of parrots are, as a rule, extremely loud and harsh; but many of the fleshy-tongued species can be taught to articulate words and even sentences in a perfectly intelligible manner. Most parrots are expert climbers, and in scrambling about use the bill as well as the feet, the upper mandible being peculiarly movable. The tongue in some species is also used as an organ of touch, almost of prehension, objects being often held and handled between the tip of the tongue and the hook of the beak. These birds are mostly vegetarian, feeding upon seeds and especially soft fruits, but some are carnivorous. Their temper is uncertain, though several kinds exhibit the most affectionate and gentle disposition, at least toward one another. In size and shape parrots differ greatly, more than is usual among the representatives of any one family of birds: some of the smallest species are no larger than sparrows, as those of the genus *Nasiterna*, while the great macaws attain a length of about three feet. Their coloration is equally diversified: some are black or gray; some are snowy-white; green is the most characteristic color; yellow, red, and blue, often of the most brilliant tone, are very common; and many parrots are variegated with all these colors. The sexes are usually colored alike. Gaudiness of coloration reaches its extreme in the macaws, while the most beautiful and dainty tinting is common among the lories, and plain or somber shades are exceptional throughout the order. Of parrots of all kinds there are about 350 species, classed in from 25 to 100 genera according to the views of different ornithologists. They abound in all tropical countries, but seldom extend into temperate countries, except Australia and New Zealand. In round numbers, the geographical distribution of parrots is as follows: America is richest in species, having 150, only one of which occurs in the United States, though two or three others come nearly or quite to the Mexican border; the Moluccas and Papuan islands have 80 species, Australia 60, and Polynesia 30; 25 are African; and 20 are peculiar to Asia. Total part, a part in which the whole is implied. = *Syn. Part, Piece, Section, Portion, Share, Division*. Part is the general word for that which is less than the whole; as, the whole is equal to the sum of all its parts. Piece is a part taken from a whole; as, a piece of meat; the dish was broken or the tree was torn to pieces. Section is a part cut off, or viewed as cut off, from the rest: as, a section of land, of the party. Portion is often used in a stilted way where part would be simpler and better; portion has always some suggestion of allotment or assignment: as, this is my portion; a portion of Scripture; "Father, give me the portion of goods that falleth to me" (Luke xv. 12). Share is still more suggestive of the person connected with the matter: as, his share in the work; his portion of his father's estate was \$100,000, and he insisted upon receiving his share at once. A division is one of two or more parts made by design, the parts still remaining connected: as, a division of an army or a fleet, of a subject, of a country. See *partiele*.

Fletcher, Spanish Curate, iv. 1.

Forms of Partizans.

(a) One who is associated with another in some game or amusement: (1) One who plays on the same side, as, especially, in whist. (2) One who dances with another, especially one of the opposite sex.

Lead in your ladies every one; sweet partner, I must not yet forsake you.

Shak., Hen. VIII., l. 4. 103.

My former fears of dancing before such a company, and with such a partner, returned more forcibly than ever.

Miss Barwey, Evelina, xi.

(b) One who is associated in marriage with another of the opposite sex; a husband or wife. (c) One who is associated with another or others as a principal or the contributor of capital in a business or joint adventure, and usually shares its risks and profits. See *partnership*.

3. *pl. Naut.*, pieces of timber let in between two deck-beams, to form a framing for the support of anything which passes through a vessel's deck, as masts, capstan, or pumps.

The mast holes of a ship with wood beams are framed with a series of carlings termed fore and aft partners, cross partners, and angle-chocks, the whole forming a hole the diameter of which exceeds that of the section of the mast by twice the thickness of the mast wedges, these latter varying about from 3 inches to 6 inches, according to the size of the ship. *Tharle, Naval Arch.*, § 211.

Dormant partner, a special or silent partner.—**Ostensible partner**. See *ostensible*.—**Silent partner, sleeping partner**, a partner interested in a business in which he has embarked capital, but in the conducting of which he does not take an active part; a dormant partner.—**Special partner**, a partner who contributes capital only, in a limited or special partnership, and whose liability is limited by statute to the amount of capital. If the statute governing partnerships is violated, the special partner becomes liable as a general partner. See *partnership*.—**Syn. 1.** Participant, participant.—**1 and 2.** Friend, Companion, etc. See *associate*.

partner (pärt'nèr), *v. t.* [*partner*, *n.*] To join; associate as a partner.

partnership (pärt'nèr-ship), *n.* [*partner* + *-ship*.] 1. The state or condition of being a partner; joint interest; participation with another.

Love, well thou know'st, no Partnership allows.

Prior, Henry and Emma.

But an union of this kind is one of those fatal partnerships between the stronger and the weaker which can lead only to bondage. *E. A. Freeman, Venice*, p. 77.

Specifically—2. In *law*, the relation subsisting between persons who combine their services, property, and credit for the purpose of conducting business for their joint benefit. It involves usually a reciprocal agency and a community of profits and of losses, and often a community of interest in the capital. Since one in such a relation may make himself liable as a partner to pay debts, and yet fail to secure the right to share assets, the test of what constitutes a partner varies according as merely the relation of the parties to one another is considered, or their relation to third persons dealing with the firm. For the purpose of liability to third persons, a right to share in the profits as profits, as distinguished from receiving a compensation in proportion to profits, has been deemed the general test; but it is subject to exceptions and qualifications, and in England and some other jurisdictions the test is whether the relation was such that the one sought to be held liable had constituted the other his agent to contract such obligation.

3. The contract creating the relation of partners.—4. A rule in arithmetic. See *fellowship*. 4.—**General partnership**, a partnership in which the relation is not qualified as *limited* or *special*, and in which, therefore, all the members are jointly liable for all the debts.—**Limited partnership, or special partnership**, a partnership in which the special partner contributes to the common stock a specific sum in cash, and is liable for the debts of the partnership only to the amount of his investment. This immunity is secured by compliance with the statutes creating it, which usually provide that the special partner shall take no part in the conduct of the business.—**Mining partnership**, a partnership which exists when two or more persons, who own or acquire a mining-claim for the purpose of working it and extracting the mineral therefrom, actually engage in working the same: the chief peculiarity of the relation in this case is in the implied powers of the partners, and the fact that the transfer of the share of a partner to a stranger brings in the latter without dissolving the partnership.—**Universal partnership**, a form of association existing in Louisiana, in which all the partners agree to put in common all the wealth they have and may acquire. Exception, however, is now made of wealth acquired by gift, succession, or legacy after the partnership had been constituted.

part-owner (pärt'ō'nèr), *n.* In *law*, a joint owner or tenant in common, who has an independent, although an undivided, interest in property with another or others.

A gallinaceous or rorial bird of the family *Tetraonidae* and of one or

another of the subfamilies *Perdiciæ*, *Caccabineæ*, and *Ortygineæ*, of small size as compared with grouse (*Tetraoninae*), with four toes, scaly shanks seldom spurred, fairly well-developed tail, and naked nostrils. (a) The birds more particularly designated partridges are the European species of the genera *Perdix* and *Caccabis*. The best-known of these is the common gray partridge, *Perdix cinerea*, the only bird of

Common Gray Partridge (*Perdix cinerea*).

the kind that is common in Great Britain, and hence the one specifically called a *partridge* in English. It extends through Europe, and in Asia is replaced by closely related forms, as *P. barbata* and *P. hodgsoniæ*. Other Asiatic birds which have *partridge* as at least the book-name are species of *Oreoperdix*, *Amuoperdix*, *Arborophila*, *Bombuscolia*, etc. Those of the last-named genus are known as *bamboo-partridges*. (b) In Europe other birds properly called partridges are species of *Caccabis*. The red-legged, French, or Guernsey partridge is *Caccabis risa*; the Greek partridge is *C. græca*; the rock-partridges are *C. saxatilis* and *C. petrosa*. Related to these in Asia and Africa are other species of *Caccabis*. Snow-partridges belong to the genus *Lerwa* or *Tetraoperdix*, as *L. or T. nicicola*, and to *Tetraonallus*. Of the latter genus are the chourka (*T. caspius*), the Himalayan partridge (*T. himalayensis*), and other species. The hill-partridges are a dozen or more species of *Arborophila*, found in India and countries further east, and several of *Galloperdix*. (See cut under *Galloperdix*.) The very numerous species of francolins are often brought under *Perdiciæ*, and some of them are called *black partridges*. They are mostly African. (See cut under *francolin*.) (c) All the partridge-like birds of America are entirely different from any of the foregoing, and constitute a separate subfamily called *Colinæ*, *Ortygineæ*, or *Odontophorineæ*; these are in different parts of the United States (as explained under *pheasant*) known as *partridges* or *quails* (quail being properly the name of the Old World birds of the genus *Coturnix*). The common partridge or quail of the United States is the Virginian bobwhite, *Colinus or Ortyx virginianus*, and it is the only one that is extensively dispersed in the country. But in the southwestern States and Territories are found numerous other partridges or quails, of the genera *Oreortyx*, *Lophortyx*, *Callipepla*, and *Cyrtonyx*; while ranging through Mexico and Central America and well into South America are yet others, belonging to the genera *Euphydryx*, *Dendrortyx*, and *Odontophorus*. See cuts under *Caccabis*, *Callipepla*, *Cyrtonyx*, *helmet-quail*, *Lerwa*, *Odontophorineæ*, *Oreortyx*, and *quail*. See also *grouse*.

sentative example of the *Oseines* or normal *Passeres*. The name lapsed, or was used with little discrimination, for a century, but is now in nearly universal use for that genus of finches which contains the common European or so-called English sparrow (*P. domesticus*), the European tree-sparrow (*P. montanus*), and several other closely related species. The two species named are both naturalized in the United States. See *sparrow* and *house-sparrow*.

Passerculus (pa-sér'kü-lus), *n.* [NL. (Bonaparte, 1838), < L. *passerculus*, a little sparrow, dim. of *passer*, a sparrow; see *Passer*².] A genus of American fringilline birds, embracing many of the commonest sparrows of the United States, of fully streaked coloration, with yellow on the bend of the wings, slender bill, short and narrow unmarked tail, and pointed wings with elongated inner secondaries. The common savanna-sparrow is *P. savanna*, and there are several others. They are ground-sparrows, and especially abound in low moist localities.

Passerella (pas'e-rel'ä), *n.* [NL. (Swainson, 1837), dim. of L. *passer*, a sparrow; see *Passer*².] A genus of large handsome fox-colored fringilline birds of North America, having enlarged feet; the fox-sparrows. *P. iliaca* abounds in shrubbery in most parts of eastern North America, and several other species or varieties are found in the west. See *fox-sparrow*.

Passerellinae (pas'e-re-l'i-nä), *n. pl.* [NL. (S. F. Baird, 1858), < *Passerella* + *-inae*.] A sub-family of *Fringillidae*, named from the genus *Passerella*, having no definable characters.

Passeres (pas'e-rez), *n. pl.* [NL., pl. of L. *passer*, sparrow; see *Passer*².] An order of the

class *Aves*, typified by the genus *Passer*, comprehending more than half of all birds. It has about the taxonomic or classificatory value of groups called *families* in departments of zoology other than ornithology. It corresponds inexactly to *Insectores* in some of the uses of this word, and exactly to the *uvierian Passerine* as emended by Blyth; also to the *Egithonathæ* of Huxley. It consists of the *Oscines* (Muller) and *Cyanatoræ* of Cabanis. With some exceptions, these birds (numbering upward of 5,000 species) have the following characters. They are anomalognathous, having no ambiens muscle nor accessory femorocaudal. The femorocaudal and semitendinosus muscles are present, as is usually also the accessory semitendinosus. The flexor longus hallucis, the muscle which bends the hind toe, is separated from the flexor longus digitorum, which bends the other toes collectively; and the hind toe is inserted low down, or is perfectly incumbent. The result of this is that the feet are perfectly fitted for grasping slender supports, and the birds are thus typically insessorial. Furthermore, the toes are always 4, 3 in front and 1 behind (except in *Choloriina*); none are versatile from their normal position, and the ratio of their phalanges is always 2, 3, 4, 5, counting from the first to the fourth digit. As to the means of flight, of which no *Passeres* are deprived, the sternum has with few exceptions a particular conformation, being notched on each side behind, manubriated, and provided with prominent costal processes; the tensor patagii brevis has a special mode of insertion; the primaries are either 10 or 9 in number, the secondaries are more than 6, and the greater coverts are not more than half as long as the secondaries. The tail has 12 rectrices (with few exceptions). The palate is egithonathous; the covering of the bill is hard, with a cere or other soft membrane, and the nostrils do not openly communicate; the oil-gland is nude; the cerea are 2 in number; and the carotid is single and sinistral. *Passeres* are altricial and pilopædic, the young being horn helpless and naked. In most birds of this order the lower larynx, or syrinx, is highly developed as a musical organ, and according to this character *Passeres* are divisible into 2 primary groups—*Oscines* or *Acronyodi*, and *Cyanatoræ* or *Mesonnyodi*. The division of *Passeres*, however, has severely exercised alike the erudition and the ingenuity of the systematists, and no proposed method is fully accepted. The prime division by Garrod and Forbes, into *Eleutherodactyli* and *Desmodactyli*, is superfluous, since those alleged *Passeres* which are demodactylous are not *Passeres*. Elimination of these obstructive terms leaves the prime division as before, into *Acronyodi* and *Mesonnyodi*. In 1874 Wallace divided *Passeres* upon external characters into 4 series: (1) *turdoid*, with 21 families; (2) *tanagroid*, with 10 families; (3) *sturnoid*, with 4 families; (4) *formicarioid*, with 10 families: 45 in all—an arrangement requiring some modification upon anatomical grounds. The mesonyodian *Passeres* are either (1) heteromerous, as the families *Cotingiidae* and *Pipridæ*, or they are (2) homomerous. The latter are either (1) haplophonus, as the *Tyrannidae*, *Pittidae*, *Philepittidae*, and *Xenidae*, or they are (2) tracheophonous, as the *Furnariidae*, *Pteropochidae*, *Dendrocolaptidae*, and *Formicariidae*. With few exceptions, mesonyodian *Passeres* are American, and nearly all of these (all but a few *Tyrannidae*) are Central and South American. As to the acronyodian *Passeres*, they are either abnormal or normal. The abnormal *Passeres* are only two Australian families, *Menuridae* and *Atrichidae*, together called *Pseudoscines*. The rest are *Oscines* proper, some 4,700 species in all, so closely related that they scarcely represent a group of higher rank than the average "family" recognized by ornithologists. They are three of Wallace's four series (*turdoid*, *tanagroid*, and *sturnoid*), and are separated by Sundevall into *Cichloromorphæ*, *Controrostres*, *Columbomorphæ*, *Certhiomorphæ*, *Cinnyrinomorphæ*, and *Chelidonomorphæ*. Sclater has six similar divisions, though in different order and under other names: *Dentirostres*, *Latirostres*, *Curvirostres*, *Tenuirostres*, *Controrostres*, and *Cultrirostres*. These groups may be thus explained or illustrated: (1) *Cichloromorphæ* or *Dentirostres*, thrushes, warblers, flycatchers, shrikes, etc.; (2) *Columbomorphæ* or *Cultrirostres*, crows, jays, tita, etc.; (3) *Controrostres*, hunches, buntings, sparrows, tanagers, etc.; (4) *Cinnyrinomorphæ* or *Tenuirostres*, honey-suckers; (5) *Certhiomorphæ* or *Curvirostres*, creepers; (6) *Chelidonomorphæ* or *Latirostres*, swallows. All these birds agree in being lamniplantar; and among them or near them must be found or made a place for the larks, *Alaudidae*, which are scutelliplantar, and which, when not placed with *Controrostres*, form a seventh superfamily known as *Corydonomorphæ*.

passeriform (pas'e-ri-fôrm), *a.* [*NL.* *passeriformis*, < *L.* *passer*, sparrow, + *forma*, form.] Sparrow-like in form or structure; pertaining to oscine *Passeres* or *Passeriformes*, or having their characters; passerine in a strict sense.

Passeriformes (pas'e-ri-fôr'mêz), *n. pl.* [*NL.*: see *passeriform*.] In Forbes's classification, an order of anomalognathous birds composed of *Turdiformes*, *Fringilliformes*, and *Sturniformes*, or the *turdoid*, *tanagroid*, and *sturnoid* *Passeres* of Wallace, and thus equivalent to oscine *Passeres*, or *Oscines*.

Passerina (pas-e-ri'nî), *n.* [*NL.*, fem. of *L.* *passerinus*, of or for a sparrow: see *passerine*.] 1. A beautiful genus of American *Fringillidae*; the painted finches. The plumage is of bright or variegated colors, or both, as in the indigo-bird, *P. cyanea*, which is rich blue, the lazuli-finch, *P. anaetha*, which is blue, white, and brown, and the painted finch, or nonpareil, *P. ciris*, which is blue, red, and yellow. Vieillot, 1816. Also *Cyanospiza*. See cut in next column, and cut under indigo-bird.

2. A genus of heath-like shrubs, of the apetalous order *Thymelæaceæ* and the tribe *Euthymelæaceæ*, known by its four-lobed unappended urn-shaped calyx, eight exerted stamens, and globose stigma. There are 4 species, all South African, sometimes cultivated for their flowers. They bear little

decussate opposite leaves, and flowers in spikes with broad bracts. *Linnaeus*, 1737.

Passerina (pas-e-ri'nâ), *n. pl.* [*NL.*, pl. of *Passerina*.] 1. In Cuvier's system of classification, the second order of birds, approximately equivalent to the *Insectores* or perchers; primarily divided into two groups, the ordinary *Passerinae* and the *Syndactyli*, and, secondarily, the former into four groups, *Dentirostres*, *Fissirostres*, *Conirostres*, and *Tenuirostres*. As thus constituted, it was a thoroughly unnatural group, subdivided in an equally artificial manner. But removing from it certain heterogeneous elements, as *Cypselus*, *Caprimulgus*, *Polaropus*, *Colinus*, *Coracias*, *Uropygia*, *Merops*, *Trochilus*, etc. (as was done by Blyth, Cuvier's editor in 1849), it represents the *Passeres* of modern naturalists.

2. In Nitzsch's classification, the expurgated *Passerinae* of Cuvier, or *Passeres* proper.

passerine (pas'e-rin), *a. and n.* [*L.* *passerinus*, of a sparrow, < *passer*, sparrow: see *Passer*.] 1. *a.* Resembling or related to a sparrow; of or pertaining to the *Passerinae*, in any sense, or the *Passeres*: passeriform.—2. And as he [God] is the Head of that body, he is *passible*, so he may suffer; and, as he is the first-born of the dead, he did suffer; so that he was defective in nothing; not in power, as God, not in passibility, as man.

Donne, Sermons, I.

passibleness (pas'i-bl-nes), *n.* Passibility.

This heresy of Eutyches and Dioscorus . . . drew after it the heresy of the *passibleness* of the Deity, because the Deity of Christ was become, in their conceits, the same nature with the humanity that was passible.

Passiflora (pas-i-flô'rî), *n.* [*NL.* (Linnaeus, 1737), irreg. < *L.* *passio*, passion, + *flos* (*flor-*), flower. Early missionaries to South America, and Spanish writers from 1593, regarded the flower as an emblem of the crucifixion, finding in the five anthers the five wounds, in the three button-like stigmas the three nails, in the corona the crown of thorns, in the five petals and five sepals the ten apostles then present, in the digitate leaves the persecutors' hands, and in the tendrils their scourges.] A genus of climbing herbs or shrubs, type of the order *Passifloraceæ* and the tribe *Passifloreæ*, characterized by the short calyx-tube, three styles, and the calyx-lobes, petals, and stamens each four or five; the passion-flowers. There are about 175 species, mainly American; a few are Asiatic and Australian. They bear lateral unbranched tendrils, and alternate leaves, undivided or lobed, often with a gland-bearing petiole. Their large and showy flowers are solitary or racemed in the axils, followed by dry or pulpy many-seeded berries, which in some species are edible. (See *granadilla*, *curuba*, *may-pop*, *indigo-berry*, 2, *water-lemon*, and *arret calabash* (under *calabash*), also cut under *arroz*.) Some species are narcotic or expectorant, as *P. foetida*, the West Indian love-in-a-mist, and the bitter leaves of *P. laurifolia*, the Jamaican honeysuckle, are used as an astringent. *P. macrocarpa*, the pumpkin passion-flower of Brazil and Peru, produces a fruit sometimes weighing 8 pounds. Many species are cultivated for the beauty of their flowers, as *P. curulea*, *P. keraeana*, etc. See also *bulbhoof* and *Dutchman's-laudanum*.

Passifloraceæ (pas'i-flô-râ'sê-ê), *n. pl.* [*NL.* (Endlicher, 1836), < *Passiflora* + *-aceæ*.] An order of plants of the cohort *Passiflorales*; the passion-flower family. It is characterized by the undivided or three- to five-parted style, four to many stamens, similar petals and sepals, and especially by the corona, of one, two, or many rows of filamentous bodies, or a tubular membrane, seated on the calyx-tube or between the petals. It includes about 235 species, mainly tropical, especially of South America, classed in 5 tribes and 27 genera, of which *Passiflora* (the type), *Cariceæ*, *Jacaratiæ*, and *Tacsonia* are the chief. They are shrubs, trees, or herbs, with a watery juice, round or angled branches, and erect climbing or twining stems. They often bear axillary tendrils and showy three-bracted flowers.

Passiflorales (pas'i-flô-râ'lêz), *n. pl.* [*NL.*: < *Passiflora* + *-ales*.] A cohort of polypetalous plants of the dicotyledonous series *Calyceifloræ*, characterized by the compound one-celled ovary, with styles distinct or slightly united. It includes the passion-flower, gourd, and loasa families, mainly vines; the begonia family; and the samyda, turnera, and datiscæ families, mainly tropical trees and shrubs.

Passifloreæ (pas-i-flô'rê-ê), *n. pl.* [*NL.* (A. L. de Jussieu, 1805), < *Passiflora* + *-eæ*.] A tribe of plants of the order *Passifloraceæ*, distinguished by the perfect flowers, conspicuous single or double corona, and flattish seeds. It includes 13 genera, chiefly of the African and American tropics, of which about 13 species are shrubs or small trees, and 100 are tendril-climbers.

A vibrating lever operates a registering device, which indicates the number of steps taken, the lever moving synchronously with the upward and downward movement of the body in walking or running.

passing-bell (pàs'ing-bel), *n.* A church bell tolled at the time of a person's death or immediately after. It was a means of summoning Christians to pray for the soul of the one just departed; and it is still common as a mark of respect to the dead and an announcement to the public that a death has just occurred. The age of the person is commonly indicated by the number of strokes. This custom is supposed to have originated from the ancient belief that the sound of the church bell drove away any demon that might seek to take possession of the departing soul. In the Church of England it is enjoined by canon that the *passing-bell* be tolled during the dying and at the burial of any parishioner. Formerly called *forth-fare*.

All my spirits,
As if they heard my *passing-bell* go for me,
Pull in their powers, and give me up to destiny.

Fletcher (and another), Sea Voyage, iii. 1.

When the *passing-bell* doth tole,
And the furies in a shole
Come to fight a parting soule,
Sweet Spirit, comfort me!

The personages usually introduced are the Evangelist or Narrator, the Saviour, the Disciples, the People, etc.; allegorical or idealized characters also occur. Recitatives, solos, duets, choruses, and even instrumental numbers, are employed as in other oratorios, but, at least in the German *passions*, the liturgical style controls every element; hence chorals are often introduced for the use of the congregation or audience. An annual feast of the Jews, instituted to commemorate the escape of the Hebrews in Egypt, when God, smiting the first-born of the Egyptians, "passed over" the houses of the Israelites, which were marked with the blood of the paschal lamb. It was celebrated on the evening of the 14th day of Abib or Nisan, the first month of the sacred year. The name is also used, by extension, to include the seven days that followed (from the 15th to the 21st of Nisan), during which the Israelites were permitted to eat only unleavened bread; and hence the *Passover* is also known as the "feast of unleavened bread." Every household with his family ate on the first evening a lamb killed by the priest (Ex. xii.), which was served up without breaking the bones.

And ye shall observe this thing for an ordinance to thee and to thy sons for ever. . . . And it shall come to pass, when your children shall say unto you, What mean ye by this service? In some states no person is allowed to leave the country without a *passport* from his government, but the regulations of different jurisdictions regarding the use of *passports* have varied much, and of late years have exhibited a tendency toward a relaxation

of stringency, extending in many countries to their total abolition. Passports must give a description of the person. Those of the United States (1887) "request all whom it may concern to permit — safely and freely to pass, and in case of need to give (him) all lawful Aid and Protection," and are given under the seal of the Secretary of State. In porcelain the difference is more radical, the paste of soft-paste porcelain not being strictly a ceramic production. (*See soft-paste porcelain*, under *porcelain*.) The epithets *hard* and *soft* have reference to the power of resisting heat, hard-paste porcelain supporting and requiring a much higher temperature than the other. For the *paste* operation, no leys should be used contain-ing foreign salts.

=*Syn. Pastime, Amusement, Recreation, Diversion, Entertainment, play.* The italicized words keep near to their meaning by derivation. The central idea of a *pastime* is that it is so positively agreeable that it lets time slip by unnoticed; as, to turn work into *pastime*. *Amusement* has the double meaning of being kept from ennui and of finding occasion of mirth (see *amuse*). *Recreation* is that sort of play or agreeable occupation which refreshes the tired person, making him as good as new. *Diversion* is a stronger word than *recreation*, representing that which turns one aside from ordinary serious work or thought, and amuses him greatly. *Entertainment* has come to have great breadth, ranging from amusement in its narrower sense to *diversion* and to the idea of a set exercise, as a concert, or to the articles of food furnished to guests; generally, however, *entertainment* stands for that which is social and refined.

The patagia of the pterodactyls or extinct flying reptiles were wings, constructed upon lengthened digits, much like those of bats. The case is different with the flying-lizards of the present day, in which the patagium is stretched upon extended ribs. See cut at *dragon*. Also called *parachute*. (b) The grant by a government to the author of a new and useful invention, or to his assigns, of the exclusive right of exploiting that invention for a specified term of years; also, the instrument or letters by which a grant of land is made by a government to a person or corporation. By the United States Revised Statutes, sec. 4886, etc., any person, whether a citizen or an alien, may obtain patent protection for the term of seventeen years "who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned." The fact that the invention has been first patented in a foreign country will not debar the inventor from obtaining a valid patent in the United States, unless the same has been here "introduced into public use for more than two years prior to the application." But the patent will expire with that foreign patent having the shortest term. In the application of the several clauses of this statute, distinctions arise of difficult and delicate character, which are the constant subject of controversy. For the United Kingdom of Great Britain and Ireland and the Isle of Man, patents are granted (under 46 and 47 Vict., c. 57, 1883) to any person, whether British subject or not. The general principles as to what constitutes an invention or improvement are substantially the same as above stated. For each of the principal British colonies there is a separate statute.

=**Syn. 1. Patience, Fortitude, Endurance, Resignation.** *Patience* is by derivation a virtue of suffering, but it is also equally an active virtue, as *patience* in industry, application, teaching. Passively, it is gentle, serene, self-possessed, without yielding its ground or repining; actively, it adds to so much of this spirit as may be appropriate to the situation a steady, watchful, untiring industry and faithfulness. *Fortitude* is the passive kind of patience, joined with notable courage. In *endurance* attention is directed to the fact of bearing labor, pain, contumely, etc., without direct implication as to the moral qualities required or shown. *Resignation* implies the voluntary submission of the will to a personal cause of affliction or loss; it is a high word, generally looking up to God as the controller of human life. *Resignation* is thus generally a submission or meekness, giving up or resigning personal desires to the will of God.

Gouverneur of the Tongue.

When we transfer the term "cause," then, from a relation between one thing and another within the determined world to the relation between that world and the agent implied in its existence, we must understand that there is no separate particularly in the agent, on the one side, and the determined world as a whole, on the other, such as characterizes any agent and *patient*, any cause and effect, within the determined world.

patina (pat'i-nā), *n.* [*< L. patina*, *patena*, a broad shallow dish, a pan: see *paten*¹, *pan*¹.]

1. A bowl; a patella.—2. (a) An incrustation which forms on bronze after a certain amount of exposure to the weather, or after burial beneath the ground. It is, when perfectly developed, of a dark-green color, and has nearly the composition of the mineral malachite (hydrated carbonate of copper). Such an incrustation, although very thin, is considered to add greatly to the beauty of an antique object, especially of a bust or statue, and is of importance as protecting it from further oxidation. Artificial and evanescent patinas are produced by forgers of antiquities by the application of heat or of acids, and in various other ways. Some modern bronzes acquire a dark-colored patina, which is a disfigurement rather than an ornament. Elaborate investigation on the part of various chemists has failed to explain this ill-colored patina very satisfactorily. It is believed, however, that coal-smoke in large cities may be a cause of its formation, as under such circumstances it contains particles of carbonaceous matter; and also, that the present almost universal practice of putting considerable zinc into the bronze, to facilitate its casting, is one of the causes of this defect. The dark color of the patina of Japanese bronze has been shown, in a considerable number of cases at least, to be in all probability due to the presence of lead in the alloy. Also *patine*. (b) By extension, the surface-texture or -color which other works of decorative art, as a wooden cabinet or the like, gain through the action of time. (c) The surface, produced partly by accretion, partly by discoloration and the effects of acid in the soil, given to marble by long inhumation.—3. The child had no standing before the law under the head of private rights; if he entered into a contract, the benefits were acquired not for himself, but for his father. The public rights of the child, however, remained intact, as that of voting and that of holding a magistracy.

The patria potestas, so long as it lasts, gives to the father the complete control of the son's actions.

Hence—2. In subsequent Jewish history, one of the heads of the Sanhedrim after the destruction of Jerusalem and the dispersion, the patriarch of the Western Jews residing in Palestine, that of the Eastern in Babylon.—3. In the early church, and in the Orthodox Greek and other Oriental churches, a bishop of the highest rank; in the Roman Catholic Church, a bishop of the highest rank next after the Pope. In the early church the highest dignity, which came in time to be designated as that of *patriarch*, belonged from time immemorial, and as was believed from apostolic days, to the bishops of Rome, Alexandria, and Antioch—these three sees ranking as to dignity, precedence, and privileges in the order named. The Council of Constantinople (A. D. 381) gave the bishop of that see preeminence of rank next after Rome, and the Council of Chalcedon (451) confirmed this, decreeing that this canon conferred an equality of prerogatives with Rome, still leaving the latter see, however, a higher rank. Since that time Constantinople has always stood at the head of the orthodox Oriental sees, and since the sixth century its bishop has borne the title of *ecumenical patriarch*. The patriarchal dignity of Jerusalem was not recognized till the Council of Chalcedon. Constantinople, Alexandria, Antioch, and Jerusalem still remain the four great patriarchates of the orthodox Eastern Church. In 1582 Moscow was made a patriarchate, ranking next after these, but since 1721 the place of patriarch of Moscow has been represented by the Holy Governing Synod. Besides the orthodox Oriental patriarchs, there are others, representing the Armenian, Jacobite, Coptic, and other Oriental churches, and also Latin or Roman Catholic titular patriarchs of the same sees. In the Roman Catholic Church the Pope is regarded as having in his papal capacity a rank superior to his rank as patriarch, and the cardinals also take precedence of patriarchs. There are also three minor patriarchs in the Roman Catholic Church—of the Indies, of Lisbon, and of Venice. The title of *patriarch* seems to have first come into use in the Christian church in imitation of a similar title given to the head of a Jewish patria, or group of communities. In general usage it was apparently first given, without definite limitation, to senior bishops or bishops of special eminence. The bishops of the great patriarchal sees were at first called *archbishops* (in the older sense of that title). From the fourth century the title of *patriarch* came to be

commonly applied to the bishops of the patriarchal sees, and is so used in imperial laws of the sixth century. It was not, however, till the ninth century that it became strictly limited to these. Exarchs, metropolitans, and archbishops rank next after patriarchs. See *catholicus*.

The Primate of all England was also *patriarch* of all the British islands.

E. A. Freeman, Norman Conquest, V. 155.

In correctness of speech, we are assured by Theodore Balsamon, the *Patriarch* of Antioch is the only prelate who has a claim to that title—the proper appellation of the Bishops of Rome and Alexandria being Pope; of Constantinople and Jerusalem, Archbishop.

10. In *gun-making*, the distribution of shot in a target at which a shot-gun is fired. In a circle called the "killing-circle" by sportsmen and gun-makers (which at a range of 40 yards is from 26 to 30 inches in diameter), the shot should be evenly distributed, so that there can be no possibility of escape for game within the periphery of this circle. The more uniform the distribution of the shot the better is the pattern. The number of shot in the pattern varies widely, according to the size of the shot, which is selected in accordance with the kind of game sought. To secure the desired pattern it is sometimes necessary to re-bore the barrel of a gun several times.—*Dambrod, frill, hawthorn, onion, pomegranate, etc., pattern.* See the qualifying words.—**Declared pattern**, the number of pellets of a given size, which, with a given weight of the shot and a given weight of a specified kind of powder, a shot-gun is stated by the maker to be able to deliver and distribute in a "killing-circle" of a stated diameter at a prescribed range, and with a good degree of uniformity in the distribution. See def. 10.—**Syn.** 1. *Model, Ideal, etc.* See *example*.

See *pattern-chain* and *pattern-cylinder*. Also called *shuttle-box*. (*b*) The box perforated to accord with the harness-cards of a Jacquard loom. Also called *prism* or *cylinder*.

pattern-card (pat'érn-kárd), *n.* 1. (*a*) A piece of eardboard to which a sample or specimen of cloth, velvet, or the like is attached. Hence—(*b*) A number of such pieces of eardboard, forming a sort of book, or folding alternately so as to open out in a long strip and exhibit, at one time, a number of patterns of stuff.—2. In *weaving*, one of the perforated pieces of eardboard used in the Jacquard attachment to a loom. The cards are joined together in a flexible endless chain, and pass over the pattern-box, each in turn controlling the harness-system. Whenever a hole in a card and one in the box coincide, the corresponding rod connected with a warp-thread enters the hole and its warp-thread is raised. See *loom* 1.

pattern-chain (pat'érn-chán), *n.* In *weaving*, a device for automatically bringing the shuttles to the picker, according to the sequence required by the pattern. In one form, in the shuttle-boxes at the ends of the race, the links of the chain

vary in height, so as to raise the rod connected with the shuttle-boxes more or less, thus bringing one shuttle or another into position to be struck by the picker.

pattern-cylinder (pat'érn-síl'in-dér), *n.* In *weaving*, a cylinder, or in some forms of loom a wheel, with projections so arranged on its periphery that its movement shall control the harness-system and the pattern-boxes, and thus fix the pattern of the woven fabric. Also called *pattern-wheel*.

pattern-drawer (pat'érn-lrá'ér), *n.* One who designs or prepares patterns for any kind of ornamental manufacture.

pattern-maker (pat'érn-má'kér), *n.* In *mech. engin.*, a workman who makes the patterns used by molders in foundry-work. These patterns are usually made, in the first instance, of pine or mahogany, the pattern-maker working from drawings. If the patterns are to be much used, they are frequently duplicated in metal, the pattern after casting being filed and scoured smooth, then warmed, and coated with wax. Metal patterns have the advantage of not warping like wood patterns. Patterns are also sometimes made of plaster of Paris swept by templates while in a plastic state. This method has been successfully applied in architectural ironwork in the production of cornices and analogous forms. Pattern-making is a distinct trade, requiring great skill in wood-working, combining as it does the finest joinery-work with the art of wood-carving and the ability to read and interpret the most complicated mechanical drawings.

pattern-molder (pat'érn-mól'ér), *n.* One who makes molds for iron castings. *Simmonds*.

The pauldron of the right shoulder was usually smaller than that of the left, to allow of free movement of the sword-arm, and especially for passing the lance under the armpit when couched. The pauldron of the close of the fifteenth century forms an inseparable part of the articulated and elaborated suit of plate-armor. See *epaulet*.

Application of payments, appropriation of payments, the determining which of several obligations shall be extinguished or reduced, when a payment not sufficient to extinguish all is made. Thus, if a debtor owing to the same creditor an open account, a bond, and a note secured by mortgage on the debtor's property pays a sum sufficient to satisfy only one, it is for his interest that it be applied to the mortgage, so as to free his property from incumbrance; and it is for his creditor's interest that it be applied to the open account, which is unsecured, and will be outlawed before the bond. The right of application rests with the debtor at the time of paying. If he does not exercise it, it passes to the creditor. If neither debtor nor creditor exercises the right, the court, if controversy arises, makes the application on equitable principles.—Equation of payments. pea¹ (pē), *n.* [A med. form, assumed as sing. of the supposed plural *pease*: see *pease*¹. The plural of *pea* is *peas*, as 'as like as two peas,' 'a bushel of peas,' with ref. to the individual seeds, as in 'a bushel of beans'; but when used collectively the old singular *pease* is properly used, as 'a bushel of pease,' like 'a bushel of wheat or corn?'] 1. The seed of an annual hardy leguminous vine, *Pisum sativum*; also, the vine itself. The pea is marked by its climbing habit and glaucous surface, its pinnate leaves ending in a branching tendrils, its large stipules, and its large, commonly white, papilionaceous flowers, followed by pendulous pods containing sweet nutritious seeds. The original form, *P. sativum*, var. *arvense* (*P. arvense*), the common gray pea or field-pea, is thought by some to be native in Greece and the Levant, by others to have come from further north. Peas were known to the ancient Greeks and Romans, and their cultivation is now general. Usually only the seeds are edible, but the pods of the sugar-pea, skinless pea, or string-pea are eaten, as in the case of "string-beans." The seeds are now mostly consumed when green, but are also split when ripe, and used in soups or ground into meal. (See *pease-meal*.) Before the spread of the potato, peas formed in England a principal food of the working classes. The varieties are very numerous, those of the marrow class being distinguished by seeds which are wrinkled and greenish even when ripe.

Yes, yes, Madam, I am as like the Duc de Richelieu as two peas; but then they are two old withered gray peas.
Walpole, Letters, Oct. 13, 1765.

See def. 2.—2. A garden and orchard tree, *Prunus (Amygdalus) Persica*. The peach is a rather weak irregular tree, 15 or 20 feet high, with shining lanceolate leaves, and pink flowers (see cut under *calyciflorate*) appearing before the leaves. The roundish or elliptical fruit is 2 or 3 inches in diameter, and covered with down; when ripe, the color is whitish or yellow, beautifully flushed with red; its flesh is subacid, luscious, and wholesome. The peach is closely allied to the almond, from which Darwin inclines to derive it. Its local origin has commonly been ascribed to Persia, but the investigations of De Candolle point to China. It is now widely cultivated in warm-temperate climates, most successfully in China and the United States, as in Delaware, on the shores of the Chesapeake and Lake Michigan, and in California. (See *curl*, 4, *peach blight*, and *peach-yellows*.) The canning of peaches is now a large local industry; large quantities also are dried, and some are made into peach-brandy. The seeds often take the place of bitter almonds as a source of oil, etc. Peach-leaves and -flowers are laxative and anticholeric. The varieties of the peach are numberless, a general distinction lying between clingstones and free-stones (see these words), and again between the white- and the yellow-fleshed. (See *nectarine*.) The flat peach or peento is a fancy Chinese variety, having the fruit so compressed that only the skin covers the ends of the stone. Another Chinese variety, the crooked peach, has the fruit long and bent, and remarkably sweet. In ornamental use there is a weeping peach; and various dwarf and double-flowered varieties, called *flowering peaches*, have been produced with pure-white or variously, often very brilliantly, colored flowers.—**Guinea peach**, a climbing shrub, *Sarcocaulis esculenta*, of tropical western Africa, bearing heads of small pink flowers, and a pulpy collective fruit which is eaten by the natives. It is entirely confined at present to the orchards of the eastern United States, where it annually causes the death of many thousands of trees. The leaves become dwarfed, distorted, and "scorched" in appearance, the twigs pale and dwarfed, and the fruit red-spotted and prematurely ripe. In the first year the disease usually causes only a more or less premature ripening of the fruit; in the second year it is more marked, the whole tree having a sickly languishing appearance, with the entire foliage dwarfed and rolled or curled up, and yellowish or brownish-red (whence the name) in color. The diseased tree rarely dies in the second year of attack, and rarely lives beyond the fourth or fifth year. Little or no valuable fruit is produced after the second year. The cause of the disease is at present unknown, but from the investigations that are now being carried on it seems very probable that it is a bacterium. See *yellow*.

largest of the gallinaceous birds, and in full dress is the most magnificent of all birds. The gorgeous train which constitutes its chief ornament is often four feet long, and consists of an extraordinary mass of upper tail-coverts, not true tail-feathers, which latter the train overlies and far outreaches. These tail-coverts are elegantly formed of spray-like decomposed webs enlarged and recomposed at the end, and marked with glittering ocelli or "eyes." This whole mass of plumage is capable of being erected

and spread in a vertical disk completing a semicircle, or more, of the most brilliant iridescent colors, chiefly green and gold. The tail-feathers proper and the primaries are chestnut; the neck and breast are blue of a peculiarly rich tint called *peacock-blue*. The head is crested with a bunch of about twenty four upright plumes. The length proper is about four feet, the train, when fully developed, measuring from two to four feet more. The peahen is much smaller and more plainly feathered, without the train. The peacock was sacred, among the Greeks and Romans, to Hera or Juno, but is now commonly regarded as the symbol of vainglory and as a bird of ill omen. The flesh is edible, like that of other gallinaceous birds. The cry is extremely loud and harsh. See *Pava, japed*; also *cut* under *ocellate*.

Peak is of two sorts, or rather of two colors, for both are made of one shell, though of different parts; one is a dark purple cylinder, and the other a white; they are both made in size and figure alike, and commonly much resembling the English bugles, but not so transparent nor so brittle. *Beverly, Virginia, iii. § 46.*

2. The tree *Pyrus communis*. The wild tree is common over temperate Europe and Asia, often scrubby, but under favorable conditions becoming, as under culture, a handsome tree of good height, inclining to a pyramidal form. Though close to the apple botanically, it differs in its more upright habit, smooth shining leaves, pure-white flowers with purple stamens, the granular texture of the wild fruit, the juicy melting quality of the fine varieties, and the form of the pome, which tapers toward the base and has no depression around the stem. The tree is long-lived, specimens existing which are two or three hundred years old. The pear was known in a number of varieties in the days of Pliny, but its excellence is of much later date. In recent times it has received great attention, its culture being pushed with special zeal in France. It is a highly successful fruit in the United States. The varieties of pear are numbered by thousands, but only a few are really important. The Seckel is an American variety—the fruit small, but unsurpassed in quality. The Bartlett, known in Europe, where it originated, as *Williams's bon Christien*, is also universally popular. Poniologists place some others, as the *beurre d'Angou*, as high as these or higher. Dwarf pears (that is, those grafted or budded on quince-stocks) are more convenient for gardens; standard pears (that is, those grafted or budded on seedling-pear stocks) are commonly more profitable. In some regions, as England and northern France, a liquor is made from the juice of the fruit. (See *pearry*.) Pear-wood has a compact fine grain, and is highly prized for cabinet- and mill-work, etc., and second only to boxwood for wood-engraving and turnery.

pea-rifle (pē'rī'fl), *n.* A rifle throwing a very small bullet, especially used by sharpshooters before the introduction of conical balls. The range not being very great, the light ball answered its purpose, and the smallness of the bore allowed the metal of the barrel to be extremely thick—a supposed merit.

Sp. perla* = *Pg. perola, perla* = *It. perla*; < early *M.L. perula, perulus, perla*, a pearl, prob. var. of *pirula*, a little pear, dim. of *L. pīrum*, a pear; see *pearl*. Cf. *Sp. perilla*, a little pear, a pear-shaped ornament, *Olt. perola*, a little button or tassel (Florio). Cf. *purp²*.] 1. A nacereous concretion, or separate mass of nacre, of hard, smooth, lustrous texture, and a rounded, oval, pear-shaped, or irregular figure, secreted within the shells of various bivalve mollusks as a result of the irritation caused by the presence of some foreign body, as a grain of sand, within the mantle-lobes. The formation of a pearl is an abnormal or morbid process, comparable to that by which any foreign body, as a bullet, may become encysted in animal tissues and so cease to cause further irritation. In the case of the mollusks which yield pearls, the deposit is of the same substance as the nacre which lines the shell, hence called *mother-of-pearl*, in successive layers upon the offending particle. Fine pearls have frequently been found in working the mother-of-pearl shell. Chemically, pearls consist of calcium carbonate interstratified with animal substance, and are hence easily dissolved by acids or destroyed by heat. The chief sources of the supply of pearls are the pearl-oysters and pearl-mussels, *Avicula* and *Unionida*, and foremost among the former is the pearl-oyster of Indian seas, *Melagrina margaritifera*. Pearls are generally of a satiny, silvery, or bluish-white color, but also pink, copper-colored, purple, yellow, gray, smoky-brown, and black. The finest white pearls are from Ceylon, the Persian Gulf, Thursday Island, and the western coast of Australia. The yellow are from Panama. The finest black and gray pearls are obtained in the Gulf of California, along the entire coast from Lower California to the lower part of Mexico. There are two distinct varieties of pink pearl: those from the common conch-shell, *Strombus gigas*, of the West Indies, and those from the union or fresh mussels found in Scotland, Germany, France, and the United States (the finest being obtained principally from Ohio, Tennessee, Kentucky, Texas, and Wisconsin), also from the small marine shell *Trigona pectonensis* of Australia. Purple, light-blue, and black pearls are found in the common clam, *Venus mercenaria*. The yellow color of Oriental pearls generally results from the decomposition of the mollusks in which they are found. The value of a pearl depends entirely on its perfection of form (which must be either round, pear-shaped, or a perfect oval), on its luster or "orient," and on the purity of its color, a tint of yellow or gray detracting very much from the value. Pearls are sold by the pearl-grain, four grains equaling one carat. (See *carat*, n., 4.) From 1880 to 1890 the demand for pearls and the rarity of their occurrence resulted in an advance in price of from 250 to 300 per cent., the larger pearls having advanced more, proportionally, than the smaller ones. Until about 1865, pearls were generally valued as multiples of a grain. The value of a pearl larger than one grain was estimated by squaring its weight and multiplying this by the value of a one-grain pearl: thus, a two-grain and a five-grain pearl were worth respectively 4 and 25 times the value of a one-grain pearl.

Eng.*]—11. *Eccles.*, a name sometimes given to a particle of the consecrated wafer: still current in the Oriental Church.—12. A name given by gilders and manufacturers of jewelry to granules of metal produced by melting it to extreme fluidity, and then pouring it into cold water. The stream in pouring should be so small, and the crucible held at such a distance from the water, that the metal will break up into fine drops (pearls) before reaching the water, which instantly cools them. The cooled granules are usually pear-shaped. The epithet *granulated* is more commonly applied in the United States to metals prepared in this way, as granulated copper, silver, zinc, etc., used in the preparation of jewelers' alloys on account of their convenience in weighing, and for other purposes—pure granulated zinc being much employed by chemists for generating pure hydrogen gas, as in Marsh's test for arsenic, etc.

13. In *lace- and ribbon-making*, one of the loops which form the outer edge. Also *perl*.—14. In *decorative art*. See *perl*.—**Baroque pearl**. See *baroque*.—**Blind pearls**, irregular, lusterless, and valueless pearls, used for medicinal purposes in the East.—**Epithelial pearls**, small spheroidal masses of flattened epithelial scales, concentrically arranged, occurring in epithelioma. Also called *bird's-nest bodies* and *epidermic spheres*.—**Half pearls**, pieces cut from pearls that are very irregular and have only one lustrous side or corner, which is slit off. They are extensively used in jewelry, and are much less expensive than whole pearls, but are very liable to become discolored if wet, as the layers of the pearl being cut across, absorb the water, and any impurities it may contain show through the layers.—**Imitation, artificial, or false pearls** are of two kinds, *solid* or *massive pearls* and *blown pearls*. (See *Lemaitre pearl* and *Roman pearl*.) The first are known as *Venetian pearls*, and are manufactured chiefly on the island of Murano, near Venice. They are made from small white or colored glass tubes, the desired hues being produced by the use of oxid of tin and other metals. Blown pearls consist of small globules of thin glass, coated on the inside with the so-called oriental-pearl essence, or essence of orient. Their manufacture is attributed to Janin or Jaquin, who lived in Paris about 1680, and who was the first to line hollow glass balls with this mixture, which he prepared with the scales of a small fish, the bleak, common in France and Germany, and mullage. The mixture was first suggested by his observing the pearly luster of the scales that were detached from the fish when they rubbed against one another in a trough. The scales of 18,000 fish are required to make one pound of oriental-pearl essence.—**Inner pearl**, in *lace-making*, ornamental loops worked around the edge of an opening in lace, as distinguished from *pearl*, which is a loop on the outer edge.—**Large pearl**, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, these may be separated to the greatest extent without breaking the connecting thread of syrup. In this condition the sugar forms a large drop, or "pearl," if suspended from a rod.—**Lemaitre pearl**, an imitation pearl composed of a solid glass ball externally coated with a varnish composed of oriental-pearl essence, white wax, alabaster, and parchment glue. *A. Castellani*, *Gems*.—**Little pearl**, in *confectionery*, the condition of clarified sugar-syrup when it has been boiled to such a consistency that, when a drop is taken between the finger and thumb, the finger and thumb may be separated to nearly the full extent without breaking the thread of syrup. Also called *small pearl*.—**Oriental-pearl essence**. See *essence*.—**Pearl millet**. Same as *cattail millet* (which see, under *millet*).—**Pearl onion**. See *onion*.—**Roman pearl**, an imitation pearl made of a ball of alabaster or similar mineral substance, upon which is spread pure white wax, which in its turn is coated with oriental-pearl essence.—**Seed-pearls**, very small pearls or slightly imperfect pearls which are usually drilled and secured by means of a horse-hair to mother-of-pearl or other light-colored material to be worn as ornaments. Large quantities are used in the East for medicinal purposes, in the composition of electuaries supposed to possess stimulating and restorative qualities.—**Small pearl**. Same as *little pearl*.—**Smoked pearl**, mother-of-pearl having black or very dark veins or cloudings.—**Virgin pearls**, unpericed pearls of fine quality.

peat¹ (pēt), *n.* [*< ME. *pete (ML. AL. pēta), peat*. Cf. *beat*³, *sod*, *< beat*², *v.*, mend (a fire, etc.). Cf. *purse*, var. of *burse*.] 1. Partly decomposed vegetable matter, produced under various conditions of climate and topography, and of considerable importance in certain regions as fuel. Peat occurs in many countries and in different latitudes, but always either in swampy localities or in damp and foggy regions. It is formed of vegetable matter undergoing decay, and in some respects it is the modern representative of the coal of the earlier geological epochs, and its formation illustrates the conditions under which coal has originated. Peat is abundant in northern Europe, and particularly so in Ireland, where it is perhaps of greater importance as fuel than in any other country. It occurs in India, especially in the Neilgherry hills and in Bengal; also in various parts of the United States, and there are in the latter country regions (especially in New England) where it is occasionally used as fuel. The vegetation of which peat is made up in the various countries where it occurs is quite different, and occasionally the number of species which have taken part in its formation is large. The genus *Sphagnum* is an important element in much of the European peat. The peat of Bengal, on the other hand, is said to be formed almost exclusively from one plant, the wild rice, *Oryza sylvestris*. The peat of New England is made up of a considerable variety of aquatic plants. Peat is very spongy, and contains a large amount of water near the surface; the deeper down it is taken, the more compact it is. A great variety of processes for compressing and hot-drying it have been invented and put in use in different parts of the world.

2. A small block of peat-bog or -moss, resembling an ordinary brick in shape, cut and dried for fuel.

peat-bog (pēt'bog), *n.* The common name in the United States for those accumulations of peat which are known by this name in Great Britain, but also, and more generally (except in Ireland), as *peat-mosses* and *peat-moors*.

peat-charcoal (pēt'chär'kōl), *n.* Charcoal made by carbonizing peat. This is done in various ways, as in piles, open kilns, pits, and ovens. Peat-charcoal has been much experimented with, and used in metallurgical operations to some extent for fully three hundred years. The carbonization of ordinary air-dried peat produces a very friable charcoal, and the denser the peat is made, by compression or in other ways, the better the article produced.

In France *peat-charcoal*, under the name of *Charbon roux*, is much used for making gunpowder. *Ure, Dict., III. 527.*

or by admixture of other substances, as coal-dust, tar, etc. These machines are, in general, grinders and pressers, which pulp the material in order to render it homogeneous, and then compress it into blocks of convenient form.

peat-moor (pēt'mōr), *n.* Same as *peat-moss*. In the United States such deposits are called *swamps* or *bogs*. See *peat*¹ and *peat-moss*.

Peat is very largely dug in the moorlands of Somersetshire, near Edington and Slapwick, between Glastonbury and Highbridge. Some of these beds have been worked for fuel from the time of the Romans, and probably earlier, while others are of more recent formation. The *peat moors* or "turbary lands" have an irregular distribution; and the peat, which in places is 14 or 15 feet thick, is due largely to the growth of the common sedge (*Carex*), whence *Sedgemoor* derives its name.
Woodward, Geol. of England and Wales (2d ed.), p. 526.

peat-moss (pēt'mōs), *n.* 1. Moss entering into the composition of or producing peat; moss of the genus *Sphagnum*.—2. A peat-bog or -swamp; a name frequently given in Great Britain to those accumulations of peaty matter which in the United States are commonly known as *peat-bogs*.

Peat mosses cover many thousand square miles of Europe and North America. About one seventh of Ireland is covered with bogs, that of Allen alone comprising 238,500 acres, with an average depth of 25 feet.
A. Geikie, Text Book of Geol. (2d ed.), p. 444.

nous North American insect, which probably fed on some other legume before the cultivated pea was introduced; it has spread to Europe, and is now found in Great Britain and along the Mediterranean. The egg is laid on the outside of the pod, and the newly hatched larva burrows into the nearest pea, in which it feeds and grows to full size. Before transforming to the pupa it provides for its exit by cutting a round hole through all but the outer membrane of the pea. The beetle does not issue until the following spring. See *Bruchus*. Also called *pea-beetle*, *pea-bug*, and *pea-chaffer*.

peazet, *n.* An obsolete form of *poise*. *Spenser.*

A small rounded stone. The term is usually applied to stones worn and rounded by the action of water. Pebbles are less in size than cobbles; and ordinary gravels are chiefly made up of sand, the grains of which pass by imperceptible gradations of size into pebbles, with which are frequently intermixed more or less of rounded fragments large enough to be called cobbles.

My fords with pebbles, clear as orient pearls, are strow'd.

pebbling (peb'ling), *n.* [Verbal *n.* of *pebble*, *v.*] In *leather-manuf.*, a special kind of grain-*ing*, in which an artificially roughened or indented surface on the grain side of leather is produced by working upon that side with a roller having a pattern which is the reverse of the pattern to be impressed on the leather. The term is properly restricted to the act of producing an irregular pattern, such as would be produced by pressing irregularly distributed minute pebbles upon the leather; whence the name. A pattern consisting of straight or approximately straight lines is called a *straight grained pattern*, and the leather would be called *straight-grained*. The term *grain-ing* includes pebbling, which is but a special kind of grain-*ing*, of which glassing or glazing is still another variety.

pebbling-machine (peb'ling-mā-shēn'), *n.* In *leather-manuf.*, a machine resembling a polishing-machine in its construction, used to perform the special work called pebbling. The pebbling is done by a roller having on its surface the pattern, in reverse, which it is desired to impart to the grain of the leather. The roller is pivoted to elastic bearings at the lower end of a swinging arm, and is antagonized by a table curved to correspond to the are through which the roller acts. The leather is supported by the table while subjected to the action of the roller. The imparting of a pattern in imitation of more costly leather is strictly a variety of grain-*ing*, though often called pebbling. Since the machine used for glassing, glazing, or polishing is transformed into a pebbling-machine by a change in the roller only, the machine is variously and indifferently called *polishing*, *glassing*, *grain-ing*, or *pebbling-machine*.

pebbly (peb'li), *a.* [*< pebble + -y*.] Full of pebbles; abounding with small roundish stones.

Slow stream, or pebbly spring.

The microbe which causes pebrine was named by Lebert *Panhistophyton*, and classed among the psorosperms.

Schimper has grouped the *Pecopteridæ*, with regard to their relation to living ferns and with reference to the character of the fructification, in five subdivisions; but "one has only to look at the classification of a few species grouped from the apparent character of the fructifications to see how unreliable are the diagnoses derived from them" (*Lesqueroux*). The grouping of the *Pecopteridæ* suggested by the fossil botanist of the Pennsylvania Geological Survey is as follows: (1) Including the species referred by Schimper to the genus *Goniopteris*, distinguished by an upward curve of the lateral veins; (2) *Pecopteris* proper, or cyatheids, to which division belong the species answering exactly to Brongniart's definition of the genus *Pecopteris*; (3) *Pecopteris* with hairy or villous surfaces, a permanent and easily discernible character; (4) *Pecopteris* with pinnae not distinctly divided into obtuse entire lobes or pinnules, but generally cut on the borders in sharp irregular teeth; and (5) a group containing those species referred to *Pecopteris* which "do not find a place in the former divisions." Kidston (1886) divides the *Pecopteridæ* into two subdivisions, *Pecopteris* and *Dactylothea*;

the genus *Pecopteris* as limited by him includes species previously referred by fossil botanists to twenty-four different genera.

Pecopteris (pē-kop'te-ris), *n.* [NL., < Gr. *πέ-κειν*, comb, + *πτερίς*, a fern.] A genus of widely disseminated fossil ferns, occurring in large numbers in the coal-measures of Europe and America, and found also in the Middle Devonian of New Brunswick. As described by Brongniart, the genus *Pecopteris* has bipinnate or tripinnate fronds; the pinnae are long and pinnatifid; the pinnules adhere to the rachis by the whole base, and are often more or less deeply connate and not decurrent, and the borders are generally contiguous or nearly so; the secondary veins, which are derived from the median nerve of the pinnules, are simple, bifurcate, or trifurcate. (b) Of or pertaining to the pes or hind foot only: opposed to *manual*.—**3.** Pertaining to the feet of perpendiculars let fall from one point upon tangents to a fixed locus called a *basis*.—**4.** (ped'al). In *music*, relating to a pedal.—**Pedal action**, the entire mechanism of pedals, in either a pianoforte, organ, or harp, including the pedals themselves, the connecting apparatus of rods, trackers, levers, etc., and their attachment to dampers, sliders, etc.—**Pedal adductor**, the posterior adductor muscle of bivalve mollusks, the anterior one being distinguished as *pallial*. It is the only one in the *Monomyaria*, as oysters and scallops.—**Pedal aponeurosis**, the dorsal fascia of the foot.—**Pedal artery**, the dorsal artery of the foot.—**Pedal bass**. See *organ-point*.—**Pedal board**. Same as *pedal keyboard*.—**Pedal check**, in *organ-building*, a device for preventing damage to a pedal keyboard when not in use. It consists of a bar which prevents the pedal keys from being depressed until it is moved. It is usually controlled by a stop-knob.—**Pedal coupler**, in *organ-building*, a coupler which connects one of the manual keyboards with the pedal keyboard, so that the latter affects the former.

Usually each of the keyboards may be thus coupled to the pedals.—**Pedal curve** or **surface**, the locus of the feet of the perpendiculars let fall from one point upon the tangents to another locus to which the former is pedal.—**Pedal ganglia**, infra-esophageal ganglia in the nervous system of *Mollusca*. See cut under *Lamelibranchiata*.—**Pedal harmony**, in *music*, same as *organ-point*.—**Pedal harp**. See *harp*, 1.—**Pedal key**, in *organ-building*. See *key*, 1.—**Pedal keyboard**, in *organ-building*, the keyboard or set of levers intended to be played by the feet. It consists of black and white keys like the manual keyboards, only on a larger scale. Its usual compass in modern organs is from the second C below middle C to the D or the F next above it. It is sometimes *concave*, the extreme right and left levers being higher than those in the middle, or *radiating*, the front ends of the levers being nearer together than the back ends—both arrangements being intended to help the player to reach all the keys with equal ease. The pedal keyboard properly sounds the stops of the pedal organ; but it may also be coupled with either of the manual keyboards, and thus may simply extend the resources of the latter. Pedal keyboards are sometimes added to reed-organs, and even to pianofortes. See *pedalier*, and cut under *organ*.—**Pedal line**, a line through the feet of the three perpendiculars to the three sides of a triangle, let fall from any point on the circumference of the circumscribed circle.—**Pedal muscle**. (a) In *human anat.*, same as *extensor brevis digitorum pedis* (which see, under *pes*). (b) In *conch.*: (1) Any muscle of the foot or podium of a univalve. (2) The posterior adductor of a bivalve, when there are two. See cut under *Astartidae* and *Tridacnidae*.—**Pedal note**, either a note or a tone produced by a pedal key, or the same as *organ-point*.—**Pedal organ**, in *organ-building*, that one of the partial organs which is played from a pedal keyboard. Its compass is usually about two or two and a half octaves. Its stops are the deepest and most sonorous in the instrument, usually of 16- or 32-foot tone.—**Pedal origin**, the fixed point from which the perpendiculars are let fall.—**Pedal passage**, in *organ-music*, a passage or phrase intended to be performed on the pedal keyboard.—**Pedal piano**, a pianoforte with a pedal keyboard or pedaller.—**Pedal pipe**, in *organ-building*, one of the pipes belonging to the pedal organ.—**Pedal ratio**. See *foot*, 11.—**Pedal rod**, in *harp-making*, a rod connecting a pedal with the mechanism for shortening the strings.—**Pedal soundboard**, in *organ-building*, the soundboard of the pedal organ.—**Pedal stop**, in *organ-building*, a stop or stop-knob belonging to the pedal organ.—**Pedal vesicle**, one of the many little vesicles of the water-vascular system of an echinoderm which are connected with the water-foot or tube-foot, and cause the latter to protrude when full of water. See cut at *Echinoides*.

II. n. (ped'al). **1.** Any part of a machine or apparatus which is intended to receive and transmit power from the foot of the operator; a treadle: as, the *pedals* of a bicycle.—**2.** In musical instruments, a foot-lever; a metal or wooden key or projecting bar operated by the foot. (a) In the pianoforte two or three pedals are in use: one to lift the dampers from the strings (the *dampers pedal* or *loud pedal*); one to introduce a muffle between the hammers and the strings, or to lessen the distance from which the hammers strike, or to move them so that they shall strike only one string instead of the usual two or three (the *soft pedal*); and sometimes one to hold up the dampers that happen to be lifted when the pedal is pressed down (the *sustaining pedal*). The use of the damper-pedal is indicated by *ped.* at the beginning of the passage where it is needed, and by a * at its end. The use of the soft pedal is usually indicated by some such expression as *una corda*, 'one string.' The use of the sustaining pedal is usually left to the player's discretion. (b) In the pipe-organ several different kinds of pedals are used: those which form the pedal keyboard, and which are like the keys or digitals for the hands, but much larger (see *pedal keyboard*, and cut under *organ*); those which control the drawing of one or more of the stops (*combination pedals*, *composition pedals*, *crescendo pedal*, *diminuendo pedal*, *sforzando pedal*, etc.); that which controls the opening of the blinds or shutters of the swell-box (the *swell pedal*), etc. See the phrases below. (c) In the reed-organ and harmonium, one of the treadles by which the player operates the feeders of the bellows. See *reed-organ*. (d) In the harp, one of the foot-levers whereby all or some of the strings may be temporarily shortened, and their pitch raised. In modern harps seven pedals are used, any one of which may be used in two ways, raising the pitch either one or two half-steps; every pedal affects only the strings of a particular letter-name. By combining the pedals in various ways the instrument may be set in any desired key (tonality). See cut under *harp*. (e) Collectively, same as either *pedal keyboard* or *pedal organ*.

3. Same as *organ-point*.—**4.** A pedal curve or surface, or one of which another is the pedal curve or surface.—**Balanced pedal**. See *swell-pedal*.—**Combination pedal**, in *organ-building*, a metal pedal which enables the player to control the use of several stops at once by his feet. Such pedals are placed above the pedal keyboard. They are either *single-acting* or *double-acting*—the former serving either to draw or to retire certain stops, the result depending upon the registration at the moment when the pedal is used, and the latter serving both to draw and to retire certain stops, so that the result is always the same whenever the pedal is used. Combination pedals are applied to the stops of all the keyboards, usually beginning with those of the great organ. They include a *forte pedal* (single-acting), which draws all the stops of the keyboard to which it belongs; a *mezzo pedal* (usually double-acting), which draws most of the important 8-foot and 4-foot stops of its keyboard; and a *piano pedal* (single-acting), which retires all but one or two of the lighter stops. Combination pedals do not always affect the stop-knobs; if not, they are so made as to be hooked down when in use, and when they are released the combination made by the stop-knobs remains unchanged. Combination pedals of all the above varieties often control also certain of the stops of the pedal organ, so that, when a given combination on the manuals is used,

appropriate pedal stops are also drawn.—**Composition pedal.** Same as *combination pedal*.—**Coupler-pedal,** in organ-building, a pedal which controls one of the couplers, usually that which unites the great and pedal organs.—**Crescendo pedal.** See *crescendo*.—**Diminuendo pedal.** See *diminuendo pedal*, under *crescendo*.—**Double-acting pedal.** See *combination pedal*.—**Extension-pedal.** Same as either *dumper-pedal* or *sustaining pedal*. See def. 2 (a).—**First negative pedal,** the locus to which the basis locus is the pedal.—**First pedal,** the pedal curve or surface.—**Forfe pedal.** See *combination pedal*.—**Harp pedal.** Same as *soft pedal*.—**Inner pedal.** See *inner*.—**Loud pedal.** See def. 2 (a).—**Mezzo pedal.** See *combination pedal*.—**Oblique pedal,** a plane curve the locus of intersections under a constant angle of lines through a fixed point with tangents to a fixed curve.—**Open pedal.** Same as *loud pedal*.—**Piano pedal.** See *combination pedal*.—**Ratchet-pedal.** See *well-pedal*.—**Rat-trap pedal,** a kind of foot-piece used on some bicycles and velocipedes, consisting of a flat iron or steel bar bent into oblong-rectangular form, and having its meeting ends welded together. The pedal-pivot passes midwise from end to end of the pedal, through holes made in the ends; and the upper edges of the longer parallel sides are serrated. The whole thus much resembles a small steel trap with open jaws, as when set for catching rats, etc., whence the name.—**Reversible pedal.** See *coupler-pedal*.—**Second pedal,** the pedal of the pedal.—**Sforzando pedal,** in organ building, a pedal which suddenly and temporarily brings the entire power of the instrument into use, so that a forcible accent can be produced.—**Single-acting pedal.** See *combination pedal*.—**Soft pedal.** See def. 2 (a).—**Sustaining pedal.** See def. 2 (a).—**Swell-pedal,** in organ-building, a pedal which opens the shutters or blinds of the swell box, and so increases the power of the tones produced by the pipes in it.—**Toe-and-heel pedal.** Same as *balanced pedal*.

The only species, *P. murex*, is a native of India and tropical Africa. It is a smooth annual herb, with musky odor, somewhat branching, with opposite or alternate broad and coarsely toothed leaves, and yellow flowers solitary in the axils. The only OF. term answering to this form is *ped de gre*, crane's foot; *ped*, *piet*, *pie*, nom. also *pez*, < *L. pes* (*ped-*), foot; *de*, < *L. de*, of; *grue*, < *L. grus*, crane: see *foot* (and *pedal*, etc.), *de*², *Grus*, and *crane*¹. No record of the use of OF. *ped de gre* in the sense of 'pedigree,' or in any relation thereto, has been found; if so used (and no other explanation of the ME. forms seems possible), it must have been a fanciful application, in restricted AF. use, perhaps in allusion to the branching lines of a pedigree as drawn out on paper (cf. *crow's-foot*, applied to the lines of age about the eyes). The crane was at the time in question very common in England and

For the form, and the use as a surname, cf. the modern surname *Pettifer*, *Petifer*, < ME. *Pedifer*, *Pederfer*, < OF. *ped de fer*, 'iron foot.' Of the various other explanations of *pedigree*, as OF. *par degréz* (Minshew), 'by degrees,' '*pere degréz*, i. e. *desceusens seu parentela maiorum*' (Minshew), lit. 'father-degrees,' '*petit degree*' (actually so spelled in one instance in Stanburst), or other suggestions involving *petty* or *degree*, none is tenable. The mod. = *Syn. Pedigree, Genealogy, Lineage.* *Pedigree* may be used with reference either to a person or to an animal, as the *pedigree* of a horse; the others only to a person or family. In some cases it extends to geologic time: as, the *pedigree* of Cenozoic horses. *Genealogy* is the series of generations, coming down from the first known ancestor. *Lineage* views the person as coming in a line of descent, generally honorable, which, however, need not be traced, as in a *genealogy* or *pedigree*. *Pedigree* and *lineage* are generally much narrower words than *genealogy*, the last usually covering some personal history and including details of various matters of interest to the persons or families concerned.

sance styles the same name is given to gables similarly placed, even though not triangular in form, but semicircular, elliptical, or interrupted, and also to small finishing members of any of these shapes over doors or windows. In the architecture of the middle ages small gables and triangular decorations over openings, niches, etc., are often called *pediments*. These generally have the angle at the apex much more acute than the corresponding gable or gablet in Roman architecture, which, on its part, is markedly higher in proportion, or less obtuse-angled at the summit, than Hellenic pediments. See also cuts under *acrolerium*, *octastyle*, and *pedimented*.

The first pair of legs is longest, and the tarsus is broken into a long series of joints. In a former system, when the *Pedipalpi* also included the true scorpions, the term was synonymous with *Polymerosomata* and coextensive with *Arthrogastra*.

The group is now rated as an order of *Arachnida*, divided into 2 suborders, *Amblipugi* and *Uropugi*, respectively exemplified by the above-named families. See also cut at *Phrynidæ*.

Pelargomorpha (pē-lār-gō-mōrfē), *n. pl.* [NL.,

 herons, storks, ibises, and spoonbills. There are
 no basipterygoid processes; the palatines usually unite
 behind the postures; the maxillopalatines are large and
 spongy; the mandibular angle is truncate (except in the
 Hemiglotidae); the sternum is broad, and has two or four
 notches; the hallux is neither versatile nor webbed; and

are known specifically as *pelargionium* or as *Martha Wash-
 ington geranium*; other species are the single- and double-
 flowering geraniums of house culture, of which leading
 forms are the horseshoe, ivy-leaved, oak-leaved, lemon,
 rose, silver, gold-, and bronze-leaved, and tricolor *gera-

 Colony. An essential oil is made from the leaves of several
 species, especially, in Algeria, of *P. odoratissimum*. See
 geranium, 3.

Pelargopsis (pel-ār-gop'sis), *n.* [NL. (Gloger,
 1842), < *Gr. πελαργός*, a stork, + *ὄψις*, look, ap-
 pearance.] A genus of *Alcedinæ*; the stork-
 billed kingfishers, having the tail much longer
 than the bill, and the gonys sharply compressed.

Stork-billed Kingfisher (*Pelargopsis guria*).

This remarkable form has usually been placed with *Hal-
 cyon* in the dactyloctenax series, but it is near *Ceryle* in form,
 as well as in the piscivorous habits of the genus. About
 3 species inhabit the Indian and Australian regions, in
 one of which (*P. melanorhynchos*) the bill is black; in
 the rest it is red, as *P. guria*, *P. leucocephala*, etc. Also
 called *Rhampalicyon* and *Halcyon*.

Pelargi (pē-lās'ji), *n. pl.* [*L.*, < *Gr. Πελαργοί*,

 a son of Zeus and Niobe, the eponymous founder
 of the Pelasgian race.] An ancient race, widely
 spread over Greece and the coasts and islands of
 the Aegean Sea and the Mediterranean gener-
 ally, in prehistoric times. The accounts of it are
 in great part mythical and of doubtful value, and its ethno-
 logical position is uncertain.

Pelasgian (pē-lās'ji-an), *a. and n.* [*Gr. Πε-
 λασγίος*, equiv. to *Πελαργικός*, Pelargic; see *Pel-
 argic*.] I. *a.* Same as *Pelargic*.

Pelecanidæ (pel-e-kan'ī-dē), *n. pl.* [NL., < *Pele-
 canus* + *-idæ*.] A family of totipalmate natar-
 torial birds, of the order *Steganopodes*; the peli-
 canus. The name has been used as nearly synonymous
 with that of the order, and variously restricted; it is now
 usually confined to the single genus *Pelecanus*, and in-
 cludes only the pelicans. See cut under *pelican*.

Pelecanoides (pel'e-kā-noi'déz), *n.* [NL. (La-
 cépède, 1800-1), < *Gr. πελεκάν*, a pelican, + *ει-
 δός*, form.] A singular genus of the petrel fam-
 ily, *Procellariidæ*, representing the subfamily
 Pelecanoidinæ (or *Halodrominæ*); so called from
 the width of the chin and distensibility of the
 throat, suggestive of a pelican's pouch. The bill
 is broad, and the nasal tubes are vertical, the nostrils open-
 ing directly upward, unlike those of any other petrel; and
 the wings are short, contrary also to the rule in this fam-
 ily. The birds dive with facility, and resemble little auks
 rather than petrels. Two or three species inhabit south-
 ern seas, as *P. urinatrix*. The genus is also called *Halodrom-
 a* and *Puffinurra*.

Pelecanoidinæ (pel-e-kan-oi-dī'nē), *n. pl.*
 [NL., < *Pelecanoides* + *-inæ*.] A subfamily of

 canoides* alone. Also called *Halodrominæ*.

Pelecanus (pel-e-kā'nus), *n.* [NL., < *LL. pcle-
 canus, pelicanus*, a pelican; see *pelican*.] The

only genus of *Pelecanidæ*, having the bill slender
 and several times as long as the head, with a
 hook or nail at the end, and the mandibular
 rami divaricated, supporting an enormous
 pouch. The wings are extremely long, with very numer-
 ous remiges. The tail is short, and consists of 20 or more
 feathers; the feet are short and stout, and all four toes are
 webbed. (See cut under *totipalmate*.) The size is great,
 and the form is robust. The weight of the body in pro-
 portion to its bulk is reduced by its great pneumaticity.
 There are at least 6 perfectly distinct species, and some
 authors admit 9. Two inhabit the United States—the
 white and brown pelicans, *P. trachyrhynchus* and *P.
 fuscus*. (See cut under *pelican*.) The European species,
 inhabiting also Asia and Africa, are *P. onocrotalus* and *P.
 crispus*. The Australian is *P. conspicillatus*; and *P. ru-
 fescens* or *philippinus* is found in various parts of the old
 World.

Pelecinidæ (pel-e-sin'ī-dē), *n. pl.* [NL. (Hali-
 day, 1840), < *Pelecinus* + *-idæ*.] A notable fam-
 ily of *Hymenoptera*, represented by the genus
 Pelecinus alone. The species are supposed to
 be parasitic.

Pelecinus (pel-e-sī'nus), *n.* [NL. (Latreille,
 1801), < *Gr. πελεκίτιος*, a pelican; see *pelican*.]

 representing the family *Pelecinidæ*. The trochan-
 ters are one-jointed; the fore wings are without complete
 submarginal cells; the abdomen is petiolate, very long and
 slender, in the female at least five times longer than the
 head and thorax, but shorter in the male, and clavate; the
 antennæ are long, filamentous, not elbowed; and the body
 is polished-black.

 to the *Pelecyпода*; lamellibranchiate, as a mol-

 termination with the names of other molluscan classes,
 is now preferred by some conchologists to any of the
 prior designations.

Another of our vulgar makers spake as illfarringly in
 this verse written to the dispraise of a rich man and
 contentous. Thou hast a misers minde (thou hast a princes
 pelte)—a lewde terme to be spoken of a princes treasure,
 which in no respect nor for any cause is to be called *pelte*,
 though it were neuer so meane, for *pelte* is properly the
 scrappes or shreds of taylors and skynners, which are ac-
 counted of so vile a price as they be commonly cast out
 of dories, or otherwise bestowed vpon base purposes.

the ratio of the phalanges is normal. The leading families
 are *Ardeidae*, *Ciconiidae*, *Hydroidae*, and *Plataleidae*. The
 character of the group is best shown by some stork, as, for
 example, the Indian and African episcopal stork (*Dissoura
 episcopus*), whose generic name, however, indicates a re-
 markable peculiarity of the tail, which is black and forked,
 with long white under tail-coverts projecting beyond the
 true tail-feathers, as illustrated in the figure. See *rectrix*,

 argoniæ*, known by the conspicuous stipules.
 There are about 175 species, or as some estimate over 400,

 are herbs or shrubs, often viscid-pubescent and odorous,
 sometimes fleshy, bearing opposite undivided or dissected
 leaves, and flowers of scarlet, pink, white, or other colors,
 usually conspicuous and in umbels. Many species are
 cultivated for their handsome flowers or fragrant leaves,
 and from their strong tendency to hybridize these have pro-
 duced very numerous varieties; those of *P. grandiflorum*

pelican (pel'i-kan), n. [Formerly also *pellican*, *pelican*; < *ME. pelican*, *pelican*, *pelicane*, *pellican*, *pellicane*, < *AS. pelican* = *F. pelican* = *Pr. pellica*, *pelican* = *Sp. Cf. *πελεκίς* (*pelēkantis*), a woodpecker, < *πελεκάν*, hew or shape with an ax, < *πέλεκυς* = *Skt. paraçu*, an ax, a battle-ax.] 1. A large piscivorous natatorial bird of the family *Pelecanidae* and genus *Pelecanus*, having an enormously distensible gular pouch. Pelicans of some species are found in nearly all temperate and tropical countries. Deriving their whole sustenance from the water, they frequent lakes, rivers, and sea-coasts, and generally secure their prey by wading or swimming and scooping it into their pouches; though some, as the brown pelican, swoop down on the wing, like gannets. They breed usually on the ground near water, laying from one to three eggs, white-colored, equal-ended, and of rough texture. They are gregarious, and gather in immense companies at their

breeding-resorts. The birds are about as large as swans, and their short legs constrain them to an awkward waddling gait, but their flight is easy, firm, and protracted. The sexes are colored alike. The plumage is in most cases white, variously tinted with yellow and rosy hues. The American white pelican, *P. trachyrhynchus*, is five feet long and eight or nine feet in extent of wings; the general plumage is white, with black primaries, and yellow lengthened plumes on the back of the head and on the breast. The bill is surmounted in the breeding-season by a curious horny crest which is deciduous. (See ent at *rough-billed*.) The brown pelican, *P. fuscus*, is of dark and varied colors, and rather smaller than the white species. The fable that the pelican wounds its own breast and feeds its young with the blood that flows from it has no foundation in fact so far as this bird is concerned. The young are fed on fish brought to the nest in the pouch, and doubtless often macerated to some extent in the gullet—a habit common to the other birds of the same order, as comorants, gannets, etc. The myth probably arose in connection with the fabulous phoenix, and may have been borne out by some facts which have been observed in the case of the flamingo (*Phoenicopterus*), possibly furthermore acquiring some plausibility, in its application to the pelican, from a red tint that is observable on the beak or plumage of some species. The pelican has from early times been considered as an emblem of charity. See also ent under *totipalmate*.

pelvis (pě'vis), *n.*; pl. *pelves* (-vêz). [NL., < *L. pelvis*, a basin, laver; cf. Gr. *πέλις*, *πέλλίς*, *πέλλα*, a bowl: see *pelike*.] 1. A bony basin forming the most inferior or posterior one of the three great cavities—thoracic, abdominal, and pelvic—of the trunk of most terrestrial vertebrates. A perfect pelvis is formed on each side by the haunch-bones, consisting of ilium, ischium, and pubis, meeting in front at the pubic symphysis, and completed behind by the sacrum, with which the iliac bones articulate, and by more or fewer coccygeal or caudal vertebrae. But the pubic symphysis is wanting, as a rule, in animals below mammals; there is sometimes an ischial and often an iliac symphysis. In any case, a recognizable ilium or ischium or pubis, however rudimentary, constitutes in so far a pelvis. The human pelvis is complete, and

Human Pelvis, from the front.

1, crest of ilium; 2, base (uppermost) of sacrum; 3, symphysis pubis; 4, acetabulum or socket of thigh-bone; 5, iliac fossa, a part of the false pelvis; 6, ischium; 7, obturator foramen; 8, iliopectineal line, or brim of true pelvis. (Coccyx, not shown, directly behind pubic symphysis.)

of normal composition, but remarkable for its shortness, width, axial curvature, and obliquity with reference to the long axis of the body. A perpendicular to the plane of the inlet would leave the abdomen at the umbilicus, and a perpendicular to the plane of the outlet would strike the promontory of the sacrum. The pelvis is divided into *true* and *false*—the latter being that part which is above the iliopectineal line, the former below the same line, which thus represents, in part, the brim or superior strait of the true pelvis. The false pelvis is broad and shallow, composed, as far as bone is concerned, chiefly by the flaring iliac fossæ, its front wall being made by the lower part of the abdominal parietes; and in the erect attitude the mass of abdominal viscera rests largely upon this part of the basin. The true pelvis is more contracted, and chiefly bony as to its walls. Its inlet or superior plane, cordiform in shape, is circumscribed by the pelvic brim, which is formed by the iliopectineal crest, completed in front by the spine and crest of the pubes, and behind by the curved ridge and promontory of the sacrum. The lower plane, or outlet, known also as the inferior strait, is bounded by a very irregular line of bone, the point of the coccyx being

Pelvis of Horse (sacrum and coccyx removed), leaving the bones representing the "quarter," viewed from left side and behind. 1, crest of ilium; 2, surface for articulation with sacrum (not shown) to complete the pelvis; 3, narrow part of ilium; 4, acetabulum for hip-joint; 5, a small part of right pubis; 6, ischium.

in the middle line behind, and the tuberosity of the ischium on each side; between which three points the bony outlet is deeply emarginated behind, on each side, by the great sacrosacral notch, and in front by the arch of the pubes, formed by the conjoined rami of the pubes and ischia. In life these notches are largely filled in by ligaments (the greater and lesser sacrosacral ligaments on each side, and the triangular or infrapubic ligament in front). The obturator membrane also closes in

what would otherwise be a large vacancy on each side, the obturator foramen. The inlet of the pelvis is not closed by any structure; but the outlet is floored by the levator ani muscle, the skin of the perineum, and associated soft parts. The pelvic cavity contains the lower bowel and most of the organs of generation. After puberty the male and female pelvis differ usually to a recognizable extent in size and shape; that of the male being more massive and contracted, that of the female lighter and more expansive. See also *cuts under Catarrhinæ*, *Dromæus*, *Elephantinae*, *Epidæ*, *innominatum*, *ligament*, *Ornithoscelida*, *ox*, *quarter*, and *sacrum*.

Hence—2. Some pelviform structure or cup-like part. (a) The infundibuliform beginning of the ureter, constituting the principal cavity of the kidney, into which the pyramids project and the urine flows. See *cut under kidney*. (b) The lower, basal, or aboral portion of the cup or calyx of a crinoid.

3. [*cap.*] A genus of mollusks.—**Brim of the (true) pelvis**, the periphery of the pelvic inlet, separating the false from the true pelvis. Various forms of Pens.

1, quill pen, in which a is the feather, b the body, and c the nib;
2, steel pen and penholder, a being the handle, b a ferrule fitted to a
and having a clamping socket into which the pen c is inserted and
there held by pressure; 3 and 4, fountain-pens: the body of the
handle a is a hollow reservoir for ink, b is the pen-holding device,
and c and d are metal rods passing through small holes into the ink-
reservoir, along which the ink flows by capillary action to keep the
pen c supplied.

Pens of steel or gold have almost superseded the old quill
pens. Pens are also manufactured to some extent of other
metallic substances, such as silver, platinum, and alumi-
num bronze. Gold pens are usually tipped with a native
alloy of osmium and iridium. They possess the advantage
of being incorrodible by ink, besides having a fine, quill-
like flexibility, and are exceedingly durable.

sepist or cuttlebone of the cuttles. See cut
under *calamary*.—**Electric pen**, a kind of autographic
pen invented by Edison, consisting of a small perforating
apparatus actuated by an electromagnetic motor in con-

used to reproduce the lines, letters, or drawings traced by
the pen.—**Geometrical pen**, a drawing-instrument for

of paper.—**Right-line pen**, a drawing-pen or straight-

2. Sorrow for sin shown by outward acts; self-punishment expressive of penitence or repentance; the suffering to which a person voluntarily subjects himself, as by fasting, flagellation, self-imposed tasks, etc., as an expression of penitence; the outward acts by which sorrow for sin is shown.

Penance is only the Punishment inflicted, not Penitence, which is the right word.

3. *Eccles.*, sorrow for sin shown by outward acts under authority and regulation of the church; contrition manifested by confession and satisfaction and entitling to absolution; hence, absolution ensuing upon contrition and confession with satisfaction or purpose of satisfaction. Absolution has been given on these terms since primitive times in the church, and this ancient institution was afterward formally recognized as a sacrament by the Roman Catholic, the Greek, and other churches. The sacrament of penance includes four parts: contrition, confession, satisfaction, and absolution. It is required that there should be a genuine and a supernatural contrition for the sin committed—that is, a sorrow produced by the influence of the Holy Spirit, coupled with a firm purpose of amendment; that the sin should be confessed fully and unreservedly to a priest; and that satisfaction be made for it by a voluntary submission to such penalty or discipline as the priest may require and by restitution to persons wronged; and absolution can be granted only on these conditions. It can be administered by no one who has not received priest's orders. Every member of the Roman Catholic Church is obliged at least once a year to confess to his parish priest and to do penance under his direction; he cannot partake of communion without previous absolution, but is not either before confession or during his penitential discipline regarded as under ecclesiastical censure, which is inflicted on the contumacious only.

4. The penalty or discipline imposed by the priest in the above sacrament.

Their *penance* was thei suld go in pilgrimage.

the dome by two semicircular or ogival vaults, intersecting at right angles. Upon the pendentives is supported, in place of the upper part of the dome of which they are segments, an independent dome of which

the diameter is equal to that of the absent upper part of the first dome, or sometimes a lantern or a tower. The true pendentive is characteristic of Byzantine architecture, and is still commonly used in the various Oriental architectures based upon the style of building of the Greek empire. In it was found the solution of the problem of covering a rectangular space with a vault of circular plan. The term *pendentive* is often extended, but incorrectly, to any architectural device occupying the position of a true pendentive, and designed to answer the same purpose, but constructed of courses laid in horizontal beds and projecting each one beyond that below, or of a succession of arches corbelled out, or in any other manner which will meet the case. No such device, however, can be a true pendentive, unless the structure is in both form and construction a segment of a dome.

When used of an action, *pending* properly indicates the period before final judgment. Sometimes it is more loosely used to include the time which may elapse before such judgment is satisfied.

pendulum (pen'dū-lum), *n.* [*NL., a pendulum, neut. of L. pendulus, hanging, hanging down; see pendulus. Cf. pendule, pendle¹.*] 1. Anything that hangs down from a point of attachment and is free to swing.—2. In *mech.*, a body so suspended from a fixed point as to move to and fro by the alternate action of gravity and its acquired energy of motion. The time occupied by a single oscillation

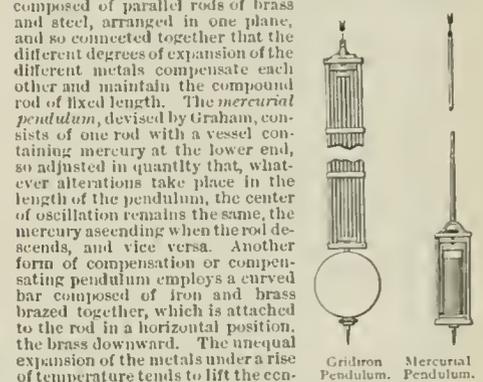

or swing is counted from the time of the descent of the pendulum from the highest point on one side till it attains the highest point on the opposite side. This time is

called the *period of oscillation* of the pendulum. A *simple pendulum* in the mechanical sense is a material particle suspended by a weightless rod and moving without friction. A single weight attached by a string, etc., approximates to an ideal simple pendulum. The period of oscillation of a simple pendulum in vacuo is

$$T = 2\pi \sqrt{\frac{l}{g} \cdot (1 + \frac{1}{16} A^2 + \dots)}$$

where $\pi = 3.141594$, g is the acceleration of gravity, l is the length of the pendulum, and A is the total arc of oscillation. The quantity in parentheses is not affected by the radical sign. It will be seen that, unless the arc is very large, the period is almost independent of its magnitude. An *compound pendulum* is any pendulum not simple. The same formula for the period applies, l being the square of the radius of gyration divided by the distance of the center of gravity from the axis of rotation. The common clock-pendulum usually consists of a rod of metal or wood, suspended so as to move freely about the point of suspension, and having a flat circular piece of brass or other heavy material, called a *bob*, attached to its lower end. The metal rod, however, is subject to variations in length in consequence of changes of temperature, and, as the accuracy of the pendulum considered as a regulating power depends upon its always maintaining the same length, various combinations of two different metals, as brass and steel, under the name of *compensation pendulums*, have been adopted in order to counteract the effects of changes of temperature. These take particular names, according to their forms and materials, as the *gridiron pendulum*, the *mercurial pendulum*, the *lezer pendulum*, etc. The *gridiron pendulum* is composed of parallel rods of brass and steel, arranged in one plane, and so connected together that the different degrees of expansion of the different metals compensate each other and maintain the compound rod of fixed length. The *mercurial pendulum*, devised by Graham, consists of one rod with a vessel containing mercury at the lower end, so adjusted in quantity that, whatever alterations take place in the length of the pendulum, the center of oscillation remains the same, the mercury ascending when the rod descends, and vice versa. Another form of compensation or *compensating pendulum* employs a curved bar composed of iron and brass brazed together, which is attached to the rod in a horizontal position, the brass downward. The unequal expansion of the metals under a rise of temperature tends to lift the center of gravity of the bob, and thus to compensate for the simultaneous increase in length of the rod. The pendulum is of great importance as the regulating power of clocks. Our clocks are nothing more than pendulums with wheel-work attached to register the number of vibrations, and with a weight or spring having force enough to counteract retarding effects of friction and the resistance of the air. A *reversible pendulum* is a pendulum so arranged that it may be suspended from either of two axes on its length at unequal distances from its center of gravity, and so placed that in the two positions each becomes axis of suspension and axis of oscillation, so that the time of vibration shall be the same in both positions. Bessel's reversible pendulum is symmetrical in external figure with respect to the plane equidistant from the two axes. Such a pendulum eliminates the effect of the atmosphere. A pendulum which makes exactly one oscillation per second is called a *seconds pendulum* (also written *seconds' pendulum* and *second's pendulum*). The length of a pendulum is the length of the simple pendulum having the same period—that is, the distance between the point of suspension and the center of oscillation (see *center*). In the latitude of New York, and at the level of the sea, the length of the seconds pendulum is 39.1 inches nearly. As the force of gravity diminishes toward the equator and increases toward the poles, the seconds pendulum is shorter in lower latitudes and longer in higher. Besides its use as a regulator in clocks, the pendulum is applied to determine the relative and absolute acceleration of gravity at different places, and in this way the figure of the earth.

A guard-ring of a watch and its attachment, by which the watch is attached to a chain.—**Axis of oscillation of a pendulum.** See *axis*.—**Ballistic pendulum.** See *ballistic*.—**Conical pendulum,** a pendulum not restricted to move in one plane, the center of gravity being only restricted to the surface of a sphere.—**Cycloidal pendulum,** a pendulum so constructed as to vibrate in the arc of a cycloid instead of a circular arc, like the common pendulum. The vibrations of such a pendulum are perfectly isochronous.—**Electric pendulum.** (*a*) See *electric*. (*b*) A pendulum that at some point of its path closes a circuit, this in turn either reporting the beats of the pendulum at distant stations for time-comparisons, or directly controlling a number of clocks. See *electric clock*, under *clock*.—**Foucault's pendulum,** a conical pendulum with a very long wire and a heavy body, designed to exhibit the revolution of the earth. At the north pole, the plane of oscillation, really remaining fixed, would appear to rotate about the vertical once in twenty-four hours. At the equator there should be no such effect; and at other latitudes there should be a slower rotation. See *composition of rotations*, under *rotation*.—**Gyroscopic, hydrometric, etc., pendulum.** See the adjectives.—**Invariable pendulum,** a pendulum intended to be carried from station to station, and to be oscillated at each so as to determine the relative acceleration of gravity at those points. This method assumes that the pendulum is not bent nor its knife-edges altered in position or sharpness in the course of transportation. Hence it is called *invariable*, not as being incapable of change, but as being secured against change for a limited time.—**Long and short pendulum,** a pendulum for determining the absolute force of gravity, consisting of a bob suspended by a wire the length of which

can be varied by a measured amount.—**Pendulum ferry-boat**, a ferry-boat that is swung from bank to bank of a river by the force of the current, requiring but little labor to guide or propel it. Boats on this principle are made fast to an anchor or to moorings placed up-stream in the middle of the river.—**Pendulum governor**, in *mech.*, a governor consisting of two revolving pendulums, of equal length and weight, attached to a spindle, the spindle and the pendulums having a common axis of rotation, and the spindle being driven by the motion of the engine or machine to be controlled. The angular velocity of revolution of the pendulums bears a constant ratio to the velocity of the prime mover. The pendulum-rods or -arms are thus made to take and hold a definite angle with the axis of their revolution, so long as the speed of the prime mover remains constant. Increase of speed in the latter increases this angle, and decrease of speed diminishes it. The pendulum-arms are connected by links to a collar that slides on the spindle, and the motion of this collar is made to regulate a valve supplying steam or gas to an engine, a belt-shift that moves a belt on cone-pulleys, or mechanism controlling the partial opening or closing of a gate supplying water to a wheel, etc. The supply of power is thus varied according to requirements, and the variation in velocity is confined to narrow limits. See *governor*, 6.—**Pendulum press**, a punching-press in which the punch is driven into the die by a swinging pendulum lever usually having a ball or weight at the lower end, and actuated by the foot of the operator, while with his hands he holds the piece to be punched.—**Pendulum pump**. (a) A direct-acting donkey-pump in which the fly-wheel oscillates in a vertical plane. (b) A pump in which the reciprocating motion of the piston is controlled by a pendulum. (c) A pump the handle of which swings on either side of its center of suspension. *E. H. Knight*.—**Simple pendulum**. (a) See def. 2, above. The act of penetrating or piercing.—2. Power of penetrating; specifically, in *gunn.*, the depth a projectile will pass into any material against which it is fired. The penetration into earth or sand is generally expressed in feet; into armor or metal plating, in inches. The English "thick-plate formula," now much used by artillerymen, is $t = \frac{E}{0.56 \cdot 2.035^2}$, in which t = the penetration in inches, and E = the energy in foot-tons per inch of circumference of shot.

3. Mental acuteness; discernment; insight: as, a man of extraordinary *penetration*.

To a profound philosopher like myself, who am apt to see clear through a subject, where the *penetration* of ordinary people extends but half way, there is no fact more simple and manifest than that the death of a great man is a matter of very little importance.

(b) Of a telescope, its space-penetrating power, as Herschel called it—i. e. the number of times by which the distance of an observed star might be increased while still appearing of the same brightness in the telescope as it does to the naked eye. It is proportional to the square root of the illuminating power, and for an achromatic telescope is approximately equal to four times its aperture in inches.—**Penetration-twin.** See *twin*. = *Syn. 3. pinguin¹ (pen'gwin), *n.* [Formerly also *pinguin*, *pinguin* (cf. *F. pingoin*, *pingouin* = *D. pinguin* = *G. pinguin* = *Sw. Dan. pinguin*, a penguin, = *Russ. pingvin*, an auk, *<* E.): origin uncertain. According to one view *<* W. *pen gwen*, 'white head,' the name being given to the auk in ref.

to the large white spot before the eye, and subsequently transferred to a penguin. According to another view, *pinguin* or *pinguin* is a corruption (in some manner left unexplained) of E. dial. *penic* or *pinic*, the pinion or outer joint of the wing of a fowl (*<* *pen*², *quill*, + *wing*): this name being supposed to have been given orig. to the great auk (in allusion to its rudimentary wings) and afterward transferred to the penguins.] 1. The great auk, *Alca impennis*: the original sense.—2. Any species of the family *Spheniscidae* or *Aptenodytidae*. (See *Spheniscidae* for technical characters.) Penguins are remarkably distinguished from all other birds by the reduction of the wings to mere flippers, covered with scaly feathers (see *Impennes*, *Squamipennes*), used for swimming under water, but unfit for flight. The feathers of the upper parts have also broad flattened shafts and slight webs, being thus like scales: the feet are webbed and four-toed, though the hind toe is very short; the tail is short and stiff; the general form is stout and ungainly. On land the birds stand nearly erect and waddle clumsily, but they are agile and graceful in the water. They feed on fish and

other animal food, and congregate on shore to breed in penguineries of great extent. Penguins are confined to the southern hemisphere, especially about Cape Horn and the Cape of Good Hope, and islands in high southern latitudes, coming nearest the equator on the west coast of South America, as in the case of Humboldt's penguin of Peru. There are more than a dozen species, referable to three

Emperor Penguin (*Aptenodytes forsteri*).

leading types. Those of the genus *Aptenodytes* are the largest, standing about three feet high, and have a slender bill. The name *Patagonian penguin*, applied to these, covers two species or varieties—a larger, the emperor penguin, *A. forsteri* or *imperator*, and a smaller, *A. pennanti* or *rex*. (See *emperor*.) *Jackass-penguins*, so called from braying, are medium-sized or rather small, with stout bill, as *Spheniscus demersus* of South Africa and *S. magellanicus* of Patagonia. (See cut at *Spheniscus*.) None of the foregoing are crested; but the members of the genus *Eudyptes* (or *Catarractes*), as *E. chrysoeome* or *chrysolophus*, known as *rock-hoppers* and *macaronis*, have curly yellow plumes on each side of the head. (See cut at *Eudyptes*.) Other medium-sized penguins are *Pygoscelis teniata*, *P. antarctica*, *P. antipoda*, and *Dasyrhynchus adeliae*. The smallest penguin, about a foot long, is *Eudyptes minor* of Australian and New Zealand shores. The largest, which was taller than a man usually is, is a fossil species named *Paleoeudyptes antarcticus*, from the New Zealand Tertiary.—**Papuan penguin**, a misnomer of *Pygoscelis teniata*, a penguin of the Falklands and some other islands, but not of Papua.

The penis in the vertebrates is generally, in part at least, homologous with the organ so named in man, but not in the invertebrates; it is sometimes double, as in certain reptiles, crabs, etc. In some invertebrates the term is extended to organs which deposit spermatozoa without being intromittent. Many of the older writers on entomology included under this term all the external male organs of generation, dividing them into the phallus, or true intromittent organ, and the forceps or claspers used in copulation. The corresponding organ of the female sex in mammals is termed the *clitoris*. See cuts under *Dendrocaela*, *Lepididae*, *Protoclepas*, *Alcippe*, *Balanus*, *Cestoidea*, and *Squillidae*.

2. *Eccles.*, one who makes confession of sin and undergoes, under priestly direction, the ecclesiastical discipline prescribed for its absolution. In the early church the penitents formed a distinct class, which included only those under ecclesiastical censure, admitted to do public penance under the direction of the church. Only marked lapses were recognized, but these were punished with long and severe penalties, sometimes lasting many years. The privilege of penance was usually granted but once. The penitents were classified in four grades—mourners, hearers, kneelers, and standers or consistents. Owing to the change of circumstances and the relaxation of discipline, public confession gradually ceased to be required, but private confession of mortal sins has been considered necessary in the Roman Catholic Church and of divine obligation. The Greek Church still requires confession for all grave sins, but its discipline is not so strict as that of the Roman Church. See *penance*.

The four orders of *penitents* were . . . the Flentes, whose place was in the porch; the Audientes, in the narthex; the Consistentes and Substrati, in the lower part of the nave. *J. M. Neale, Eastern Church*, i. 208.

Peter's pence, an annual tax or tribute in several countries of northern Europe, consisting of a penny, formerly paid to the papal see at Rome. In England it is said to have originated under Offa of Mercia in the eighth century, and it was abolished by Henry VIII. The sums now sent to Rome under the name of Peter's pence are voluntary contributions by Roman Catholic people everywhere for the maintenance of the Pope. Also *Peter-pence*.

The old payment called *Peter-pence*, from the days of the Merican King Offa, was originally made for maintaining an English college in Rome. Baronius and other Roman writers misrepresented this payment as a quit-rent for the kingdom, and an acknowledgment of dependence on Rome. They have been sufficiently confuted by Spelman and Collier.

In modern English books it is generally assumed that this is the six-pointed star formed of two triangles interlaced or superposed. (Compare *Solomon's seal*, under *seal*.) Obviously, the pentacle must be a five-pointed or five-membered object, and it should be considered as equivalent to the *pentagram* or *pentaptha*. (See also *pentangle*.) The construction of the five-pointed star depends upon an abstruse proposition discovered in the Pythagorean school, and this star seems to have been from that time adopted as their seal.

The genus was formerly classed by Rudolphi, its founder, among the trematode worms, or flukes, but is now usually referred to the arthropods, and placed in the vicinity of the mites or of the bear-animals (*Aretisa*). The body is long, annulated, and vermiform, limbless in the adult, with four

They record the creation, the diffusion of peoples, and the formation of the Hebrew nation and its history through the sojourn in the wilderness. Opinions regarding the authorship of these books differ greatly. Some scholars believe that they, with the book of Joshua, were written substantially by Moses, Joshua, and their contemporaries; others hold that they were compiled at a much later period (in part about the seventh century B. C., or even in post-exilic times).—**Samaritan Pentateuch**, a copy of the Pentateuch in the Samaritan or ancient Hebrew character, which perhaps dates from the seventh century B. C.

They are of Paleozoic, and especially Carboniferous, age. Very different limits have been assigned to the family. (a) By D'Orbigny, 1832, it was intended to include all the regular blastoid erinoids. (b) By Etheridge and Carpenter it was limited to regular blastoids with base usually convex, five spiracles whose distal boundary is formed by side plates, and hydrospires concentrated at the lowest part of the radial sinus.

The feast of Pentecost, while primarily connected with the celebration of the completion of harvest, by the offering of first fruits, etc., seems also to have been associated in the minds of the later Jews with the giving of the law on the fiftieth day after their departure from Egypt. It always precedes the Jewish New Year by 113 days.

2. The feast of Whitsunday, a festival of the Christian church, observed annually in remembrance of the descent of the Holy Ghost upon the apostles during the feast of Pentecost. Pentecost is the third of the great Christian festivals, the other two being Christmas and Easter. It is connected with its Jewish predecessor, not only historically (Acts ii. 1-11), but also intrinsically, because it is regarded as celebrating the first fruits of the Spirit, as the Jewish Pentecost celebrated the first fruits of the earth (Lev. xxiii. 17). In the primitive church the term *Pentecost* was used both for Whitsunday and for the whole period of fifty days ending with Whitsunday.

of the luminous body. The figures represent the so called Hipparchan diagrams of a lunar and a solar eclipse. Any portion of the moon in penumbra appears slightly dimmed, the more so the nearer it is to the umbra. At a station of the earth in the moon's penumbra, the disk of the sun is partially hidden, forming a partial (or, possibly, an annular) eclipse.

If the source of light be a point, the shadow is sharply defined; if the source be a luminous surface, the perfect shadow is fringed by an imperfect shadow called a *penumbra*. *Tyndall*, *Light and Elect.*, p. 13.

There are 2 species—one Chinese, the other of eastern North America.

penumbral (pē-num'bral), *a.* [*<* *penumbra* + *-al*.] Pertaining to or resembling a penumbra.

Swift, *Panegyrick on the Dean*.

=**Syn. 3.** *Parsimonious*, *Penurious*, *Miserly*, *Close*, *Niggardly*, *Stingy*, *Mean*, covetous, avaricious, illiberal, sordid, chary. The first seven words express the spirit or conduct of those who are slow to part with money or other valuable things. *Parsimonious* is perhaps the most general of these words, literally sparing to spend, but always careful and excessively sparing. *Penurious* means literally in penury, but always feeling and acting as though one were in poverty, saving beyond reason; the word is rather stronger than *parsimonious*, and has perhaps rather more reference to the treatment of others. One may be *parsimonious* or *penurious*, through habits formed in times of having little, without being really *miserly*. *Miserly*, feeling and acting like a miser, is generally applied to one who, having some wealth, clings to it for fear of poverty, or in provision for some possible exigency of the future, or especially for its own sake, as delighting in the mere possession of wealth. *Close* has the vigor of figurative use; it may be a shortening of *close-fisted*. *Niggardly* is the least limited to money, and has the most to do with others; it expresses a meanly parsimonious treatment of others, a neglectful, self-defeating, or stingy saving. *Stingy* expresses the most of opprobrium: as, Queen Elizabeth was called *frugal* by her friends, *stingy* by her enemies, and *parsimonious* by the rest of the world. It indicates a grudging, narrow-hearted or unreasonable parsimony in giving or providing. *Mean* shows a tendency toward emphasizing the idea of a close or narrow and mean-spirited handling of money. See *avarice*.

penuriously (pē-nū'ri-us-li), *adv.* In a penurious or parsimonious manner; with scanty supply.

Unless 'twere Lent, Ember-weeks, or fasting dayes,

The common peony is *P. officinalis*, an herb with large, commonly red flowers, one on a stalk, a native of southern Europe and central Asia. A kindred species, *P. tenuifolia*, of Siberia and parts of Europe, has the leaves finely cut, and hence is called *slender-leaved*, *fennel-leaved*, *fern-leaved*, or *fringed peony*. A second typical species is the tree peony, *P. montan*, a taller shrubby species from China, where it is a favorite, with large rose-colored or nearly white flowers, several on a stalk. These and one or two other species furnish the numerous hybrid and other varieties of the gardens, which vary greatly in color and are often double. The root of the common peony was an ancient charm and medicine, and still has some repute as a nerve.

The word *nation* stands for a political body viewed as a whole. The unity may be ethnic, instead of political; this sense, however, is less common. *Race* is the most common word for all those who seem to make a whole in community of descent and are too numerous to be called a *tribe*, *clan*, or *family*; as, the Anglo-Saxon *race* is one branch of the Germanic, tracing its descent through certain Low German *tribes*. *Tribe*, apart from certain peculiar meanings, stands for a subdivision of a *race*: as, the twelve *tribes* of Israel; ordinarily the word is not applied to civilized persons; we speak of *tribes* of Indians, Arabs, Africans. *Clan* is used chiefly of the old organization of kinsmen among the Scotch Highlanders; where used of others, it expresses a similar organization, with intense loyalty and partisanship.

-ion (a form expressing action or an active faculty):

Originally, and most commonly down to the middle of the eighteenth century, cognition; thought and sense in general, whether the faculty, the operation, or the resulting idea. Most psychologists since Plato had made two departments of mental action, the oretic and the speculative; the latter was called *perception*, but it did not include belief founded on testimony. This use of the word is now uncommon in technical language.

This experiment discovereth *perception* in plants, to move towards that which should comfort them, though at a distance.
Bacon.

[The Hobbesians] stontly contending that we have not the *perception* of anything but the phantasms of material objects, and of sensible words or marks, which we make to stand for such objects. *Dr. H. More*, immortality of Soul.

The two great and principal actions of the mind, . . . *perception*, or thinking, and volition, or willing.
Locke, Human Understanding, II. vi. 2.

All the *perceptions* of the human mind resolve themselves into two distinct kinds, which I shall call impressions and ideas.
Hume, Treatise of Human Nature, I. i. 1.

2. The mental faculty, operation, or resulting construction of the imagination, of gaining knowledge by virtue of a real action of an object upon the mind. It includes the first sensation, its objectification, its location, its intuitive assimilation of ideas already in the mind—in short, all the knowledge that is acquired involuntarily without our being aware of any process, and which seems to be directly given by sense. *Perception* may be internal or external.

Perception . . . being the first step and degree toward knowledge, and the inlet of all the materials of it.
Locke, Human Understanding, II. ix. 15.

Perception is most properly applied to the evidence we have of external objects by our senses.

Reid, Intellectual Powers, I. i.

Perception is a complex mental act or process. More particularly, *perception* is that process by which the mind, after discriminating and identifying a sense-impression (simple or complex), supplements it by an accompaniment or escort of revived sensations, the whole aggregate of actual and revived sensations being solidified or "integrated" into the form of a percept—that is, an apparently immediate apprehension or cognition of an object now present in a particular locality or region of space.
J. Sully, Outlines of Psychol., p. 152.

The manner in which the constituent elements in a *perception* are combined differs materially from what is strictly to be called the association of ideas. To realize this difference we need only to observe first how the sight of a suit of polished armor, for example, instantly reinstates and steadily maintains all that we retain of former sensations of its hardness and smoothness and coldness, and then to observe how this same sight gradually calls up ideas now of tournaments, now of crusades, and so through all the changing imagery of romance.
J. Ward, Encyc. Brit., XX. 57.

3. An immediate judgment founded on sense or other real action of the object upon the mind, more or less analogous to what takes place in vision. Thus, we are said to recognize our friends by *perception*. Also, mathematical, esthetic, and moral judgments founded on direct observation of imaginary or ideal objects are called *perceptions*.

It is admitted on all sides that the *perception* of an object necessarily implies the recognition of the object as this or that, as like certain objects, and as unlike certain other objects. Every act of *perception*, therefore, involves classification.
J. Fiske, Cosmic Philos., II. 107.

Her physical organization, being at once delicate and healthy, gave her a *perception*, operating with almost the effect of a spiritual medium, that somebody was near at hand.
Hawthorne, Seven Gables, vi.

A great method is always within the *perception* of many before it is within the grasp of one.
De Morgan.

Perhaps the quality specially needed for drawing the right conclusion from the facts, when one has got them, is best called *perception*, delicacy of *perception*.

They reproduce by fission and by sporulation. The modern family corresponds to several older groups of similar names and less exact definition.

Lithologists are by no means agreed in regard to the nomenclature of the varieties of peridotite. M. F. Wadsworth distinguishes the following: *dunite*, composed almost entirely of olivin, with a few grains of picrotite, magnetite, or some other accessory mineral; *saxonite*, a variety consisting of olivin and enstatite; *therzokite*, of olivin with enstatite and diallage; *buchnerite*, of olivin, enstatite, and augite; *ulyssite*, of olivin and diallage; *picrotite*, of olivin and augite. Of these varieties, the first four have been found in meteorites as well as in terrestrial rocks; the others, so far as known, are exclusively terrestrial. Olivin passes readily into serpentine; hence many olivin rocks are found more or less completely altered into that mineral, so that the distinction between olivin and serpentine rocks is one not easily preserved. Peridotite is known to be in some cases an eruptive rock, and is generally supposed to have been such in all cases. That most serpentine rocks are the result of the alteration of some peridotite material is also generally conceded; that serpentine may have been produced in some other way is possible, but has not been distinctly proved.

In the former, a periodic function is one whose operation being iterated a certain number of times restores the variable. Thus, 1 - x is such a function, since 1 - (1 - x) = x. But in the theory of functions a periodic function is defined as a function having a period. If the chemical elements are arranged in the order of their atomic weights, at regular intervals of the series will be found elements which have similar chemical and physical properties—that is, there is a periodic recurrence of these properties. If the elements showing this periodic recurrence are arranged in order by themselves, they form a group which, having similar properties and relations, follows a regular progression in the individual differences of its members.—Periodic stars. periscope (per'i-skōp), *n.* [*periskopion*, look around, < *περί*, around, + *σκοπεῖν*, look.]

1. A general view or comprehensive summary. [Rare.]—2. An instrument by which objects in a horizontal view may be seen through a vertical tube. It is used in piloting submarine boats, and consists substantially of a vertical tube with a lenticular total-reflection prism at the top, by which horizontal rays are projected downward through the tube, and brought to a focus, after which they are received by a lens the principal focus of which coincides with that point. The vertical cylindrical beam thus formed is converted into a horizontal one again by a mirror inclined at 45° from the vertical axis of the tube, and is thus conveyed to an eyepiece, through which, by turning the tube on its vertical axis with its attached prism, a view of all the supernatant objects around the vessel may be obtained. A screen or diaphragm operated by a tangent-screw is used to cut off the view of the vertical plane in which the sun is.

It is probable that the peculiar structure of the crystalline lens . . . confers on the eye the capacity of seeing distinctly over a wide field, without changing the position of the point of sight. This capacity he [Dr. Hermann] calls *periscopism*.

See *fever*¹.—**Peritoneal fossæ**, pocket-like recesses of the peritoneum, such as Douglass's pouch, the rectovesical pouch, etc. Also called *peritoneal recesses*.—**Peritoneal ligaments**, certain reflections of the peritoneum from the walls of the abdomen or pelvis to the viscera, such as the ligaments of the liver, spleen, uterus, and bladder.—**Peritoneal sac**, in echinoderms, that part of the primitive vasoperitoneal vesicle of the embryo which gives rise to the peritoneum.

peritoneum, **peritonæum** (per'i-tō-nē-um), *n.* [= F. *péritoine* = Sp. *peritoneo* = Pg. It. *peritoneo*, < LL. *peritonæum*, *peritonæum*, < Gr. *περιτόναιον*, prop. neut. of *περιτόναιος*, stretched over (*περιτόναιος ἕμψιν* or *χρόν*), the membrane inclosing the lower viscera, cf. *περιτοικός*, stretched over, < *περιτείνειν*, stretch over or around, < *περί*, around, + *τείνειν*, stretch: see *tone*.] 1. The membrane lining the abdominal cavity and investing its viscera. It is a strong, uncolored, transparent, serous membrane, with a smooth, moist, shining surface, attached to the subjacent structures by the subperitoneal areolar tissue, and forming a closed sac, except in the female, where it is continuous with the mucous membrane of the Fallopian tubes, or oviducts. From the walls of the abdominal and pelvic cavities it is reflected at various places over the viscera, which it serves to invest and at the same time hold in position by its folds or duplicatures. These folds or duplicatures are of various kinds. Some of them, constituting the mesenteries, connect certain parts of the intestinal canal with the posterior abdominal walls; others form the so-called ligaments of the liver, spleen, stomach, and kidneys; the broad ligaments of the uterus, and the suspensory ligament of the bladder; still others form the omenta, folds attached to the greater and lesser curvatures of the stomach. That part which lines the abdominal and pelvic walls is called the *parietal* or *external* peritoneum; that which more or less completely invests the viscera, the *visceral* or *internal*. The cavity of the peritoneum is divided into two unequal parts by the constriction at Winslow's foramen; of these, the upper posterior one, lying back of and below the stomach and liver, is called the lesser cavity; the greater cavity lies in front and below. In vertebrates below mammals, in which there is no diaphragm, the peritoneum and the pleura (which is the corresponding thoracic serous membrane) are thrown into one, lining the whole pleuroperitoneal cavity and investing its contained viscera. The name *peritoneum* is extended to various similar or analogous, though not necessarily homologous, membranes or tunics which line the body-cavity of many different invertebrates.

Peritoneum of Human Female, in longitudinal section, somewhat diagrammatical.

2. In brachiopods, an investment of the alimentary canal, by which the latter is suspended in the perivisceral cavity as by a mesentery. Special folds form the gastroparietal and ileoparietal bands, respectively connecting the stomach and intestines with the parietes.

3. In *entom.*, the outer coat of the digestive tube of an insect.

Peritricha (pe-rit'ri-kā), *n. pl.* [NL., neut. pl. of **peritrichus*: see *peritrichous.*] An order of ciliate *Infusoria*, containing those which have a zone of cilia about the body. In those instances in which the adoral wreath takes a spiral form the right limb is more usually involute and descending into the oral fossa. The anal aperture is posteriorly located or debouching upon the vestibular or oral fossa. The endoplast is mostly elongate, band-like. These infusorians multiply by longitudinal or transverse fission. There are eight or ten families, all free excepting the *Vorticellidae*. See cut under *Vorticella*.

See cut under *Actinozoa*.—**Perivisceral cavity.** See the quotation.

What is called a *perivisceral cavity* may be one of four things: 1. A cavity within the mesoblast, more or less representing the primitive blastocœle. 2. A diverticulum of the digestive cavity, which has become shut off from that cavity (enterocœle). 3. A solid outgrowth, representing such a diverticulum, in which the cavity appears only late (modified enterocœle, or schizocœle). 4. A cavity formed by invagination of the ectoderm (epicœle). And whether any given *perivisceral cavity* belongs to one or other of these types can only be determined by working out its development. *Huxley, Anat. Invert., p. 544.*

The D. form at the time in question was *perruycke*, *perhuycke* (Kilian). Similar interchange of *ui* (*ui*) and *u* appears in the history of *cubeb* (ME. *quibbe*, etc.), *cushion* (ME. *quishen*, etc.), *cut* and *quid* (AS. *cutu*, *cwidu*), *quick* (AS. *ceicu*, *cucu*), etc. From *periwig*, regarded appar. as *<* *peri-* + **wig*, as something put 'around' the head, was derived, by omission of the supposed prefix, or by mere abbreviation (as in *bus* for *omnibus*, *run* for *caravan*, etc.), the form *wig*: see *wig*.] 1. These are natives of southern Europe, trailing plants with deep-colored evergreen leaves and blue flowers, in *V. minor* varying to white—often known as *myrtles*. The small species is the more hardy, and hence the more common northward. *V. herbacea*, another European species, differs from these in that its tops die down annually. *V. rosea*, sometimes called *Madagascar periwinkle* though native of tropical America, is an erect plant with continuously blooming showy rose-purple or white flowers, excellent for bedding or in the greenhouse.

Wüleker, 94, 14), "chelio, testudo, uel marina gualia, sisenæl ['sea-snail'] uel *perwinculan*" (id., 122, 23); but according to the entry in Bosworth (ed. Toller), *perwinculan* is here an error for *perwinculan* (due to the frequent confusion of the AS. *p* and *w*, which are very much alike in the manuscripts); the first element in *perwinculan* or *perwinculan* is uncertain; the second, *wincle*, appears as E. *winkle*: see *winkle*. Wedgwood, referring to the equivalent dial. name *perwincle* and *pinwate*, explains *perwincle* or the supposed AS. *perwincle* as "pinwinkle, or winkle that is eaten by help of a pin used in pulling it out of the shell." For this there is no evidence. The form seems to be corrupt. Cf. *perwincle*¹, *periwig*.] 1. A kind of sea-snail; any member of the family *Littorinidæ*, and especially of the genus *Littorina*. 3. In *math.*, a linear arrangement of objects resulting from a change of their order. *Permutation* differs from *combination* in this, that in the latter there is no reference to the order in which the quantities are combined, whereas in the former this order is considered, and consequently the number of permutations always exceeds the number of combinations. If *n* represents the number of quantities, then the number of permutations that can be formed out of them, taking two by two together, is *n* × (*n* - 1); taken three and three together, it is *n* × (*n* - 1) × (*n* - 2); and so on. Sometimes called *alternation*. See *combination*, 5.

A straight line is said to be perpendicular to a curve or surface when it cuts the curve or surface at a point where another straight line to which it is perpendicular is tangent to the curve or surface. In this case the perpendicular is usually called a *normal* to the curve or surface.

It corresponds in art-development to the French Flamboyant of the fifteenth century, but is without the grace, richness, and variety of French work, though some of its buildings present fine effects of masses. See also cuts under *molding* and *pinnacle*.

II. n. 1. A line at right angles to the plane of the horizon; a line that coincides in direction with a radius of the earth or with the direction of gravity. — **2.** In *geom.*, a line that meets another line or a plane at right angles, or makes equal angles with it on every side. Thus, if the straight line AB, falling on the straight line CD, makes the angles ABC, ABD equal to one another, AB is called a *perpendicular* to CD, and CD is a *perpendicular* to AB. A line is a perpendicular to a plane when it is perpendicular to all lines drawn through its foot in that plane.

3. In law: (a) A limitation intended to be unalterable and of indefinite duration; a disposition of property which attempts to make it inalienable beyond certain limits fixed or conceived as being fixed by the general law. *Pollack*. The evils incident to rendering any specific piece of land or fund inalienable, and thus shutting it out from the general circulation of property, early led the courts to hold provisions for a perpetual suspension of the power of alienation to be void. The desire of owners of estates to perpetuate the wealth of the family led to attempts to create forfeitures and gifts over to other persons, by way of shielding the successor in the title from temptation to alienate; and as the right to create life-estates and trusts, and to add gifts over to other persons upon the termination of precedent estates, could not be wholly denied, the question has been what temporary suspension of the power of alienation is reasonable and allowable, and what is too remote and to be held void as "tending to create a perpetuity." (See *reventness*.) The limit now generally established for this purpose in varying forms is substantially to the effect that no disposition of real property or creation of an estate therein is valid if it suspends the absolute power of alienation for more than a period measured by a life or lives in being plus 21 years and 9 months. Hence, since literal perpetuities are no longer known, except in the law of charities, etc., the phrase *rule against perpetuities* has come to mean in ordinary usage the rule against future estates which are void for remoteness as "tending to create a perpetuity." (b) Duration to all futurity; exemption from intermission or ceasing.

Cf. assist, etc.*] To continue steadily and firmly in some state, course of action, or pursuit, especially in spite of opposition, remonstrance, etc.; persevere, especially with some degree of obstinacy.

sistenza, < ML. **persistentia*, < L. *persisten(t)-s*, persistent: see *persisten(t)*.] 1. The quality of being persistent; steady or firm adherence to or continuance in a state, course of action, or pursuit that has been entered upon; especially (of persons), a more or less obstinate perseverance; perseverance notwithstanding opposition, warning, remonstrance, etc.—2. The continuance of an effect after the cause which first gave rise to it is removed: as, the *persistence* of the impression of light on the retina after the luminous object is withdrawn; the *persistence* of force.—**Persistence of force**, the law of mechanics. The phrase was introduced by Herbert Spencer to sum up all the laws of mechanics, especially the two principles of the permanence of matter and the conservation of energy. The law of action and reaction may be considered as consisting in the persistence of the algebraic sum of the momenta; and in fact every such law may be stated in an integrated form which contains an arbitrary constant independent of the time.—**Persistence of vision**, the continuance of a visual impression upon the retina of the eye after the exciting cause is removed. The length of time varies with the intensity of the light and the excitability of the retina, and ordinarily is brief, though the duration may be for hours or even days. The after-image may be either positive or negative, the latter when the bright parts appear dark and the colored parts in their corresponding contrast-colors. It is because of this persistence that, for example, a firebrand moved very rapidly appears as a line or circle of light. The phenakistoscope, zoetrope, and other similar contrivances depend for their effect upon this principle.—**Syn. 1. Industry, Application, etc. (see assiduity), pertinacity, doggedness.**

3. The art of representing solid objects on a flat surface so that when they are viewed the eye is affected in the same manner as it would be by viewing the objects themselves from a given point. By *perspective*, in common language, is meant *linear perspective*, or the art of delineating the outlines of objects, of their shadows, and of their reflections. The theory is that the positions of the delineated points in the picture are such that if rays, or straight lines, were drawn from the corresponding *original points* in the natural objects to the eye of the spectator, and if the picture were then interposed in the right position, it would be pierced by these rays at the *points of delineation*. It follows that perspective supposes that a picture is to be looked at with one eye placed in a particular position; and if it be otherwise looked at, the perspective necessarily appears false. This position of the eye, called the *station-*

JBCK, an original plane; *KCDL*, another original plane; *CK*, their intersection, an original line; *ABCD*, plane of delineation; *E*, station-point; *EFHG*, directing plane; *EADH*, vanishing plane of original plane *JBCK*; *BC*, its intersecting line; *AD*, its vanishing line; *FG*, its directing line; *EABF*, vanishing plane of original plane *KCDL*; *DC*, its intersecting line; *AB*, its vanishing line; *HG*, its directing line; *C*, intersecting point of line *CK*; *A*, its vanishing point; *G*, its directing point; *EG*, its director; *AC*, its delineation.

point, or *point of sight* (which phrase with old writers has, however, another meaning), is, according to the directions of most treatises, placed much too near the picture to represent the mean position of a person looking at it. *Ar-*

tists consequently find it necessary to modify the forms which strict perspective would prescribe. To ascertain how an *original line or plane* (that is, a line or plane in nature) is to be delineated, we have to consider, first, the *intersecting point or line*, also called the *intersection of the original line or plane* (that is, the point or line where the original line or plane, extended if necessary, cuts the *plane of delineation*, or the plane of the picture extended to infinity); and, second, the *vanishing point* of the original line, or the *vanishing line* of the original plane (that is, the point or line where the plane of delineation is cut by a line or plane passing through the eye parallel to the original line or plane). An original line is represented by some portion of the line from its intersecting point to its vanishing point; and every line in a given original plane has its intersecting point on the intersecting line and its vanishing point on the vanishing line of that plane. It is also proper to consider the *directing plane*, or plane through the eye parallel to the picture; the *directing line*, or line in which the directing plane cuts an original plane; the *directing point*, or point in which the directing plane is pierced by an original line; and the *director*, or line from the eye to a directing point. It is further necessary to take account of the *direct radial*, or *principal visual ray*, being the perpendicular let fall from the eye upon the plane of delineation; the *center of the picture*, or *center of vision* (called by old writers the *point of sight*), being the foot of that perpendicular; and the *principal distance*, or *distance of the picture*, being the perpendicular distance of the plane of delineation from the eye. The *ground-plane* is the level plane on which the spectator is supposed to stand. The *horizontal line*, or *horizon*, is the line in which the level plane through the eye cuts the picture, passing ordinarily through the center. This would better be termed the *horizontal line at infinity*, for, owing to the dip of the horizon (which see, under *dip*), it differs sensibly from the delineation of the true horizon. Linear perspective is merely a branch of descriptive geometry, itself an application of projective geometry. Perspective is intimately connected with the arts of design, and is particularly necessary in the art of painting, as without a correct observance of perspective no picture can have truth. Perspective is illustrated in the correct delineation of even the simplest positions of objects.

4. A drawing or representation in perspective; specifically, a painting so placed at the end of an alley, a garden, or the like, as to present the appearance of continuing it, and thus produce the impression of greater length or extent. Stage scenic painting is of this nature.

See *gauche*.—**In perspective**, according to the laws of perspective; hence, represented on a flat surface in such a way as to convey the idea of solidity and distance.—**Inverse perspective**, the art of interpreting pictures in perspective so as to ascertain the proper position of the eye and the relative positions and forms of the objects represented.—**Isometric perspective**. = *Syn.* *Opinion, Belief, Perswasion, Conviction, and Faith* agree in expressing the assent of the mind. *Opinion* has the least feeling or energy, is most intellectual. *Belief* may be purely intellectual, or largely moral by the consent of the feelings or the will. *Perswasion* is a word borrowed from the field of action; primarily, we *persuade* one to do something by motives addressed to his feelings or interests; when the will is applied to opinions, it seems to retain much of its original sense, suggesting that the *perswasion* is founded largely on the feelings or wishes: we have a *perswasion* of that which we are willing to believe. *Conviction* starts from the other side, primarily suggesting that one was rather reluctantly forced to believe by the weight of evidence; it is now more often used of settled, profound, and earnest beliefs: as, his deepest *convictions* of right and duty. *Faith* rests upon belief, but implies confidence in a person on whose authority one depends at least partly, and the gathering of feeling about the opinion held; it is a confident belief: as, to have implicit *faith* in a friend or a promise. See *inference*, and quotation from *Wordsworth* under definition 2.

Conviction and *perswasion* are commonly used as synonymous terms; or, if any difference be made between them, it lies in this, that *conviction* denotes the beginning, and *perswasion* the continuance, of assent: for we are said to be convinced when brought by fresh evidence to the belief of a proposition we did not hold for truth before, but remain persuaded of what we have formerly seen sufficient grounds to gain our credit.

4. In *astron.*, a deviation of the motion of a planet or comet from a fixed orbit or from its regular velocity in that orbit. Perturbations are caused by the gravitating action of bodies other than the primary or central body. They are commonly and conveniently conceived, not as drawing the planets out of their orbits, but as consisting in gradual changes of the elements of the orbita themselves. All perturbations due to gravitation are, strictly speaking, periodical. But

some of them, which depend upon the relative situation of the orbits of different planets, go through their changes in such vast intervals of time that they are more conveniently regarded as progressive and not periodic, and are termed *secular perturbations*; while others, depending for the most part upon the relative situations of the planets in their orbits, go through their changes in comparatively short intervals of time, and can only be represented as periodic, and these are technically called the *periodic inequalities*. = *Syn.* 1. perturbatory (pèr-tèrb'ā-tō-ri), *n.* [*< perturbate + -ory*.] A name once used by real and pretended believers in the divining-rod to indicate a hypothetical power assumed to reside in certain individuals whereby they can exert a perturbing influence upon the motion of a swinging pendulum, etc. Its characteristics were an expansive quality, residing most abundantly in the thumb and forefinger, whereby the center of gravity of a pendulum held by these digits would be caused to describe a circle, and a compressive quality, belonging to the middle finger, which resists such motion. A man with a high compressive or "active" perturbatory, touching with his middle finger the hand of another with the expansive perturbatory well developed in thumb and forefinger, might neutralize the perturbatory in the latter, which is of the "passive" variety. A person equally endowed with these perturbatories would be negative, and so forth.

The passive *perturbatory* is a high degree of expansive, and the active *perturbatory* in like manner a powerful compressive.
Jour. Franklin Inst., CXIX. 112.

The derivations of *perverse* and *froward* suggest essentially the same idea. *Froward*, however, has reference only to one's attitude in regard to obedience, and chiefly, therefore, to the behavior of children; in *Shakespeare*, of women. It is not used of a disobedient spirit toward civil law, and *perverse* is only indirectly so used. *Pervise* has reference to one's attitude, in both conduct and opinion. The *perverse* person is settled in habit and disposition of contrariness; he not only likes or dislikes, acts or refuses to act, by the rule of contradiction to the wishes, commands, or opinions of others, especially of those whom he ought to consider, but he is likely even to take pains to do or say that which he knows to be offensive or painful to them. *Perversity* may be found in a child, but it is so settled an element of character as to be rather the mark of an adult. 'rock' (see *Mat.* xvi. 18); see *pier*.] 1. A small black-and-white seabird, *Procellaria pelagica*; hence, any similar bird of pelagic or oceanic habits, with webbed feet, long pointed wings, and tubular nostrils, belonging to the family *Procellariidae* and subfamily *Procellariinae*. Many of the petrels are characterized by qualifying epithets, and others receive special names. The stormy petrels, also called *Mother Carey's*

The most numerous species to which the name is given are those of the genera *Estrelata*, *Daption*, and some others, such as the capped petrel, *Estrelata hirsutata*, and the Cape pigeon, *Daption capense*. These

are of medium size, or rather small, and almost exclusively inhabit southern seas. Petrels of the large genus *Puffinus* are commonly known as *shearwaters* and *hagdens*. The large gull-like petrels of the genus *Fulmarus* and some related genera are called *fulmars*. All are pelagic, and practically independent of land except during the breeding-season. They breed for the most part in burrows or holes in rocks by the seaside, laying a single white egg. Many of them are wont, like albatrosses, to follow ships for many days at sea, to feed upon the refuse of the cook's galley, and may sometimes be taken with hook and line. In powers of long-sustained flight they surpass all other birds, but, with the exception of one genus (*Pelecanoides* or *Halodroma*), they cannot dive. petrography (pet-rogr'fēr-ī), *n.* [= *F. pétrographie*, *<* *Gr. πέτρα, a rock, πέτρος, a stone, + γραφία, <* *γράφειν, write*.] 1. The art of writing or inscribing on stone.—2. The study of rocks; lithology; petrology. The investigation of the minerals of which rocks are made up is called *lithology*, which includes not only the determination of the mineral constituents of a rock, but also the study of the changes which these constituent minerals have undergone, either during the consolidation of the rock or at a subsequent period, in the course of those changes which are denominated *metamorphic* (see *metamorphism*)—changes often complicated and difficult to decipher. While in some rocks the constituents are crystallized in large and distinctly formed individuals, so that each species can be separated and analyzed by itself without difficulty, this is ordinarily not the case. Hence by the methods formerly pursued it was often extremely difficult, if not impossible, to make out clearly of what species the rock was composed. At the present time the method of examination of a rock consists in cutting from it one or more sections sufficiently thin to be nearly transparent; these are examined with the microscope, with and without the use of polarized light; and the optical and crystallographic appearances presented are generally sufficient to give not only a correct idea of the nature of the minerals, but also of the changes which they have undergone through various stages of metamorphism. Assistance is also afforded by the method of separation in which gravity-solutions are employed. (See *gravity-solution*.) While most geologists writing in English use the terms *lithology*, *petrology*, and *petrography* as nearly synonymous, others desire to limit the meaning of the first of these to the indoor or laboratory study of rocks, and would define *petrography* as including their investigation both indoors and in the field.

Petrography I define as that branch of science which embraces both lithology and petrology. It includes everything that pertains to the origin, formation, occurrence, alteration, history, relations, structure, and classification of rocks as such. It is the essential union of field and laboratory study. *M. E. Wadsworth, Lithological Studies, p. 2.*

Sv. petroleum* (MD. *petrolie*). *<* *ML. petroleum* (also *petroleum*, *petreolum*, *<* *MGr. NGr. πετρέλαιον*), rock-oil, *<* *L. petra* (*<* *Gr. πέτρα*), rock, + *oleum* (*<* *Gr. ἔλαιον*), oil; see *oil*.] A *ML. adj.* *petroleus*, pertaining to rocks (nent. *petroleum*, or *oleum petroleum*, rock-oil), is given.] An oily substance of great economical importance, especially as a source of light, occurring naturally oozing from crevices in rocks, or floating on the surface of water, and also obtained in very large quantity in various parts of the world by boring into the rock; rock-oil. Petroleum was known to the Persians, Greeks, and Romans under the name of *naphtha*; the less liquid varieties were called *σαφάριος* by the Greeks, and *bitumen* was with the Romans a generic name for all the naturally occurring hydrocarbons which are now included under the names of *asphaltum*, *naphtha*, and *petroleum*. The last name was not in use in classic times. The existence of petroleum in Pennsylvania and New York has been known from almost the earliest time of the settlement of those States by Europeans, but it was not until 1859, when oil was obtained by boring at Titusville on Oil Creek, a branch of the Allegheny River, that it began to be of commercial importance. At the present time (1897) the production of crude

petroleum reaches about sixty million barrels a year, and the value of the exports of this article in various forms amounts to about \$70,000,000 a year, most of the material exported being furnished by the oil-fields of Pennsylvania and western New York. The crude oil undergoes refining, and is put upon the market in various forms (see *kerosene*, *naphtha*, *rhigolene*, etc.), but much the largest part of this product has the form of an oil suitable for burning in lamps in all parts of the world. The only other oil-producing region in the world at all comparing with that of Pennsylvania and New York is at and near Baku, on the Caspian, where the existence of oil has been known from time immemorial, but where its commercial importance has only recently been realized. The exported petroleum of the United States are chiefly from rocks of Devonian age; those of Baku occur in the Tertiary. An important part of the transportation of the crude material in the United States is effected by pipes laid beneath the surface, through which the oil is forced. See *pipe-line*. Also called *coal-oil*, *earth-oil*.

The ordinary mode of multiplication is asexual, by means of zoospores, but the sexual mode of reproduction presents interesting complications, ranging from the conjugation of equivalent motile zoogametes to the impregnation of a stationary oosphere by motile antherozoids. There are great variations in the degree and development of the thallus, which is microscopic in some of the *Ectocarpææ*, and forms the largest known marine organisms in *Macrocystis*, *Neurecytis*, and *Lessonia*. The *Phæosporææ* include the *Laminariææ*, *Punctariææ*, *Sporochneææ*, *Scytosiphonææ*, *Mesoglossææ*, *Tilopteridææ*, *Ralfsiææ*, *Culleriææ*, etc. The class has also been called *Phæozoisporææ*, and includes a part of what was formerly grouped together under the names of *Fucoidææ*, *Melanosporææ*, or *Melanospermeææ*.

They bear two-ranked leathery or fleshy oblong leaves, with persistent bases which sheath the stem. The large flat flowers are white, pink, partly yellow, and crimson, or of other colors, and are remarkable among orchids for their broadly expanded lateral petals, and for a lip often prolonged at the tip into a pair of twisted tendrils or of recurved horns. *P. amabilis*, a white and yellow species from Manila, is the *Indian butterfly-plant*, and the other species the *moth-orchids* or *moth-plants* of conservatories. *P. phalanx (fā'langks or fal'angks), *n.*; pl. *phalanxes* (fā'langk-sez or fal'angk-sez). [= F. *phalange* = Pg. *phalange* = Sp. It. *falange*, < L. *phalanx* (*phalang-*), < Gr. *φάλαγξ* (*phalagx-*), a line or order of battle, a rank of soldiers, a phalanx (def. 1), also a round piece of wood, the bone between joints of the fingers and toes, etc.]

1. In *Gr. antiqu.*, in general, the whole of the heavy-armed infantry of an army; particularly, a single grand division of that class of troops when formed in ranks and files close and deep, with their shields joined and long spears overlapping one another so as to present a firm and scerred front to a foe. The celebrated Macedonian phalanx was normally drawn up sixteen ranks deep, the men being clad in armor, bearing shields, and armed with swords and with spears from 21 to 24 feet long. In array the shields formed a continuous bulwark, and the ranks were placed at such intervals that five spears which were borne pointed forward and upward protected every man in the front rank. The phalanx on smooth ground, and with its flanks and rear adequately protected, was practically invincible; but it was embroussed and slow in movement, and if once broken could only with great difficulty be reformed.

Anon they move
In perfect phalanx to the Dorian mood
Of flutes and soft recorders. *Milton*, P. L., l. 551.

2. Any body of troops or men formed in close array, or any combination of people distinguished for firmness and solidity of union.—3. In Fourier's plan for the reorganization of society, a group of persons, numbering about 1,800, living together and holding their property in common. See *Fourierism*.—4. In *anat.* and *zool.*: (a) A row or series of bones in the fingers or toes. Hence—(b) One of the bones of the fingers or toes; a digital intermode, succeeding the metacarpal or metatarsal bones, collectively constituting the skeleton of the third and distal segment of the hand or foot; so called from their regular disposition in several rows. The normal number of the phalanges of each digit is three. This is only exceptionally increased, as in the flippers of some cetaceans and extinct reptiles; but it is frequently reduced, as in most of the digits of birds, and in the inner digits of mammals which have five fingers and toes. In man the phalanges of the fingers and toes are each fourteen, three to every digit excepting the thumb and great toe, which have two apiece. The original implication of the term seems to have been any one of the cross-rows of small bones between the successive knuckles of the fingers or toes, or the longitudinal series of small bones of any one finger or toe. But usage transfers the sense of *phalanx* to any one of these bones, two or more of which are *phalanges*. One of an ancient Jewish sebool, sect, or party which was specially exact in its interpretation and observance of the law, both canonical and traditional. In doctrine the Pharisees held to the resurrection of the body, the existence of angels and spirits, the providence and decrees of God, the canonicity and authority of Scripture, and the authority of ecclesiastical tradition; politically they were intensely Jewish, though not constituting a distinct political party; morally they were scrupulous in the observance of the ritual and regulations of the law, both written and oral. The Pharisees antagonized John Hyrcanus I. (135-105 B. C.), and as religious reformers bitterly opposed the corruptions which had entered Judaism from the pagan religions. They were called *Separatists* by their opponents. In support of the authority of the law, and to provide for the many questions which it did not directly answer, they adopted the theory of an oral tradition given by God to Moses.
For the more glory of God that these things were done, the more the *Pharisees* were fret with envy against Jesus.
